PREFACE	<i>xi</i>
ACKNOWLEDGMENTS	<i>xv</i>

### I Introduction 1

The Seventeenth Century	2
Descartes	3
Newton and Fermat	6
Huygens	7
The Nineteenth Century	8
The Brachistochrone	9
References	13

### II The Calculus of Variations 14

The Statement of the Problem	15
The Problem in Three Dimensions	18
The Shortest Distance between Two Points	20
The Problem in Parametric Form	21
The Application to Geometrical Optics	24
References	27

**III Space Curves**    28

The Frenet Equations	31
The Cylindrical Helix	33
The Osculating Sphere	35
Optical Applications	38
The Directional Derivative	40
References	41

**IV Applications**    42

Maxwell's Fish Eye	43
The Heated Window	50
The Brachistochrone	57
References	61

**V The Hilbert Integral**    62

The Hilbert Integral Defined	63
A Lemma	65
The Main Theorem	66
An Illustration	71
The Parametric Case	73
Snell's Law	76
Wavefronts and Caustics	78
References	80

**VI Ray Tracing**    81

Refraction	82
Reflection	84
Transfer	84
The Sphere	86
Conic Surfaces	88
Transfer for Conic Surfaces	92
The Cylindrical Lens	95
Cartesian Ovals	97
References	103

**VII Orthotomic Systems of Rays**    104

The Total Differential Equation	105
Exactness and Integrability	107
Orthotomic Systems	108
Some Properties	110
The Orthogonal Surface	111

Canonical Variables and the Hamilton-Jacobi Equations	112
The Application to Geometrical Optics	115
The Theorem of Malus	116
References	117
VIII Wavefronts 118	
The Nonlinear, First-Order Equation	121
The Bracket	122
The Complete Integral	123
The Eikonal Equation	125
The Singular and General Integrals	126
The General Integral for Homogeneous Media	130
References	135
IX Surfaces 136	
The Theorems of Meusner and Gauss	140
The Weingarten Equations	144
Transformation of the Parameters	145
Generalized Ray Tracing	149
Caustic Surfaces	157
References	160
X Generalized Ray Tracing 161	
Spherical Refracting Surfaces	165
The General Rotationally Symmetric Surface	167
Conic Surfaces	169
The Plane Refracting Surface	170
The in-the-Large Problem	175
References	179
XI The Inhomogeneous Medium 180	
Geodesic Curves	182
Some Vector Identities	185
Geodesics on a Wavefront	187
More on the Fish Eye	189
The Pseudo-Maxwell Equations	194
References	198
XII Classical Aberration Theory 200	
The Point Eikonal	202
The Angle Eikonal	205

The Rotationally Symmetric System	207
The First Order: Gaussian Optics	209
Some Practical Formulas	214
Pupil Planes	215
The Third Order	216
The Seidel Aberrations	220
Herzberger's Diapoint Theory	228
The Convergence Problem	235
References	237

**XIII The Fundamental Optical Invariant**      239

The Inhomogeneous Medium	244
The Lens Equation	245
The Rotationally Symmetric System	249
A General Solution	251
The Residual Equations	254
A Change of Variables	256
The Final Factorization	259
References	261

**XIV The Lens Equation**      262

The Transfer Matrix	264
The Refraction Matrix	266
The Refraction Calculations	269
The Perfect Lens	276
References	280

**XV The Lens Group**      281

The Full Linear Group	284
The Lie Group	285
Subgroups	286
The Optical Application	288
Essential Parameters	289
Generators	291
Further Optical Applications	293
The Paraxial Case	294
References	297

**XVI Conclusion**      298**INDEX**      301
