Contents

Preface vii

Introduction 1

chapter 1 **Vector Analysis** 8

1-1 Vector Algebra 8
1-2 Fields and Their Graphical Representations 11
1-3 Directional Derivatives and Gradient 12
1-4 Line Integrals 14
1-5 Divergence and Gauss' Theorem 14
1-6 Curl and Stokes' Theorem 16
1-7 Time Derivatives 19
1-8 Introduction of Coordinate Systems and the Calculation of Derived Fields 19
1-9 A Few Identities 25
1-10 The Inverse Problem of Vector Analysis 25
1-11 Derived Fields of the Second Order 25
Problems 27

chapter 2 **Sinusoidal Oscillations and Waves and Their Complex Representation** 30

2-1 Complex Numbers and Their Representations 30
2-2 Sinusoidal Oscillations in One Dimension 34
2-3 Oscillations in Three Dimensions. Complex Vectors 36
2-4 Sinusoidal Waves in Scalar Fields 40
2-5 Sinusoidal Waves in Vector Fields 42
2-6 Superposition and Decomposition of Oscillations and Waves . . . 44
2-7 Cases in Which the Complex Representation Cannot Be Used . . . 46
Problems 47

chapter 3 **The Microscopic Description of Matter and the Microscopic Maxwell Equations** . . . 51

3-1 Microscopic Description of Matter 51
3-2 Microscopic Maxwell Equations 57
3-3 Field about a Spherically Symmetric Static Charge 60

3-4 Principle of Superposition 61
3-5 Coulomb's Law and the Units of Charge and Current 61
3-6 Field around a Straight Wire Carrying a Steady Current 62
3-7 Force between Parallel Currents and the Value of c 64
3-8 Measurement of Electric and Magnetic Fields 65
3-9 Field of a Plane-parallel Condenser 67
3-10 Field of a Cylindrical Solenoid 68
3-11 Conservation of Charge 68
3-12 Faraday's Law of Induction 69
3-13 Nonexistence of Magnetic Charge 70
3-14 General Solution of the Maxwell Equations 71
3-15 Wave Equation 73
Problems 74

***chapter* 4 Energy and Energy Flow in the Electromagnetic Field 77**
4-1 Work Done in Slowly Charging a Condenser 77
4-2 Work Done in Slowly Energizing a Solenoid 78
4-3 Effects When the Fields Are Built Up Rapidly 79
4-4 General Theorem on Energy 80
4-5 Discussion of the Energy Theorem 82
Problems 84

***chapter* 5 Monochromatic Dipole Radiation 87**
5-1 Formulas for the Fields of a General Monochromatic Dipole Oscillator 87
5-2 Field of a Linear Oscillator 90
5-3 Field for an Elliptical Motion 96
5-4 Wave Zone 96
5-5 Rate of Radiation by a Dipole Oscillator 98
5-6 Fields and Radiation in the Case of Several Oscillators 101
Problems 105

***chapter* 6 Diffraction. A Preliminary Description 107**

***chapter* 7 Fraunhofer Diffraction by *N* Identical Apertures . 115**
7-1 Definition of Fraunhofer Diffraction 115
7-2 Coordinate System 117
7-3 General Principles for Identical Apertures 117
7-4 Calculation of the Geometric Difference of Path 119
7-5 General Formulas for the Diffraction Pattern 120
7-6 Abbreviated Notation. The Term Normal Irradiance 121
7-7 Case $N = 2$. Young's Experiment 121
7-8 Uniform Linear Array 124
7-9 Reciprocity Theorem and Sensitivity Pattern 128

7-10 Rectangular Array 128
7-11 Crossed Array 130
7-12 Applications of Regular Arrays 130
7-13 Michelson Stellar Interferometer 133
7-14 Radio-frequency Telescopes 137
7-15 Grating Spectroscope 142
7-16 Random Array 146
Problems 152

chapter 8 Treatment of Diffraction in the Scalar Approximation. The Kirchhoff Integral 156

8-1 Scalar Theory of Light 157
8-2 Kirchhoff Integral 159
8-3 Application to Diffraction 163
8-4 Comments on the Kirchhoff Method 164
8-5 Reciprocity Theorem 166
8-6 Babinet's Principle 166
8-7 Diffraction by Plane Mirrors 167

chapter 9 Application of the Kirchhoff Integral to Fraunhofer Diffraction 168

9-1 General Formulas 168
9-2 Special Form of Babinet's Principle 171
9-3 Rectangular Aperture 172
9-4 Circular Aperture 175
9-5 Diffraction Gratings with Rectangular Apertures 176
9-6 Resolving Power of Telescope and Microscope 180
9-7 Sine Condition 183
Problems 184

chapter 10 Application of the Kirchhoff Integral to Fresnel Diffraction 188

10-1 Rectangular Aperture 189
10-2 Limiting Case of a Large Aperture. Long Slit and Straight Edge . 196
10-3 Transition to the Fraunhofer Case 199
10-4 Circular Aperture 201
10-5 Limiting Case of a Large Aperture 204
10-6 Opaque Disk 205
10-7 Zone Plate 206
10-8 Concluding Remarks on Fresnel Diffraction 207
Problems 208

chapter 11 Fourier Analysis and Its Application to Optical Problems 210

11-1 Fourier Theorem 210

11-2 Examples of Fourier Transforms 213
11-3 Theorems on Fourier Integrals 216
11-4 Multiple Integrals 219
11-5 Vector Functions 220
11-6 Occurrence of Fourier Integrals in Fraunhofer Diffraction . . . 220
11-7 Snell's Law. Resolving Power of a Prism. 221
11-8 Abbe's Theory of the Formation of Images in the Microscope . . . 224
11-9 Phase-contrast Method 232
11-10 Rationale of the Fourier Analysis of Linear Systems. 236
11-11 Examples 238
Problems 240

***chapter* 12 Radiation from Lorentz Atoms** **243**
12-1 The Geissler Tube 243
12-2 Classical Model of the Gaseous Discharge. 245
12-3 Equation of Motion and Its Solution 247
12-4 Radiated Fields and Energy. 251
12-5 Spectrum of the Radiation 252
12-6 Spectrum in the Case of Many Emissions. 255
12-7 Thermal Broadening of Spectrum Lines 260
12-8 Pressure Broadening of Spectrum Lines 264
Problems 268

***chapter* 13 Polychromatic Waves** **271**
13-1 Polychromatic Waves and Their Sources 272
13-2 Integrating and Continuous Modes of Detection. 274
13-3 Propagation of a Wave from a Small Source through an Optical System 277
13-4 Examples of Transmission Functions and Calculation of Diffraction Patterns 281
13-5 Spectrographs and the Measurement of Energy Spectra and Power Spectra. 286
13-6 Incoherence of Independent Sources 291
13-7 Rule for Incoherent Sources. 293
13-8 Diffraction with Quasi-monochromatic Sources 294
13-9 Extended Sources. 296
13-10 Coherent and Partially Coherent Sources. Lateral Coherence in Wave Fields 299
13-11 Longitudinal Coherence in Wave Fields. Michelson Interferometer and Its Use as a Spectrograph 302
13-12 Polarization of Polychromatic Waves 309
13-13 Measurement of the Stokes Parameters 313
13-14 Properties and Interpretation of the Stokes Parameters. . . . 317
13-15 Techniques for Problems Involving Polarization 320

13-16 Measurement of Spectrum and Coherence by Means of Beat Frequencies . . . 323
Problems . . . 327

***chapter* 14 Scattering** . . . **334**
14-1 Introductory Survey and Definitions . . . 334
14-2 Rayleigh Scattering by a Single Particle . . . 340
14-3 Definitions of Cross Sections . . . 343
14-4 Scattering by a Lorentz Atom and by a Free Electron . . . 344
14-5 Scattering by Gases . . . 347
14-6 Diffraction by Crystals . . . 351
14-7 Forward Scattering. Extinction . . . 355
14-8 Force and Torque Exerted on a Body by Radiation. Radiation Pressure . . . 357
Problems . . . 359

***chapter* 15 The Macroscopic Maxwell Theory** . . . **362**
15-1 Derivation of the First Form of the Macroscopic Equations . . . 363
15-2 Classification of Charges and Currents. Second Form of the Macroscopic Equations . . . 365
15-3 Susceptibilities, Permeabilities, and Conductivity . . . 369
15-4 Monochromatic Plane Waves in Homogeneous Media . . . 371
15-5 Theory of the Complex Refractive Index . . . 376
15-6 Energy Theorem . . . 383
Problems . . . 385

***chapter* 16 Reflection and Transmission** . . . **388**
16-1 Collection of Formulas for a Single Medium . . . 388
16-2 Boundary Conditions . . . 389
16-3 Reflection and Transmission at a Single Interface. General Formulas . . . 390
16-4 Case of Two Transparent Media . . . 397
16-5 Reflection from Metals . . . 401
16-6 Layered Structures. Descriptive Survey . . . 402
16-7 Airy Formula . . . 403
16-8 Fabry-Perot Interferometer . . . 405
16-9 Fabry-Perot Etalon as a Spectrometer . . . 408
16-10 Interference Filters . . . 412
16-11 Single Dielectric Film . . . 412
16-12 Multiple Dielectric Films . . . 415
Problems . . . 417

***chapter* 17 Double Refraction** . . . **420**
17-1 Introductory Survey . . . 420
17-2 General Laws for Plane Waves . . . 427
17-3 Nonactive Uniaxial Crystals . . . 428

17-4 Nonactive Biaxial Crystals . . . 430
17-5 Double Refraction at a Boundary . . . 432
17-6 Applications of Double Refraction in Crystals . . . 435
17-7 Optical Activity in Isotropic Media . . . 438
17-8 Optically Active Anisotropic Crystals . . . 441
Problems . . . 443

chapter 18 **Magneto-optics and Electro-optics** . . . **445**
18-1 Survey of Effects . . . 445
18-2 Zeeman Effect . . . 448
18-3 Faraday Effect . . . 451
18-4 Cotton-Mouton Effect . . . 453
18-5 Kerr Electro-optic Shutter . . . 455
Problems . . . 457

chapter 19 **Relation of Quantum to Classical Theory** . . . **460**
19-1 Characterization of Radiation Fields . . . 461
19-2 Radiation in Thermal Equilibrium. Cavity and Blackbody . . . 462
19-3 Planck's Law and Its Forerunners . . . 465
19-4 Old Quantum Theory of Atoms . . . 469
19-5 Einstein's Derivation of Planck's Law. Transition Probabilities . 471
19-6 Lifetimes and Oscillator Strengths . . . 473
19-7 Quantum Theory of Atoms and Radiation . . . 477
19-8 Amplification by Stimulated Emission. Maser and Laser . . . 486
19-9 Recoil. Doppler Shift. Mössbauer Effect . . . 489
Problems . . . 491

Appendix A Electrical Units . . . 493
Appendix B Radiation Field of a Dipole Oscillator . . . 508
Appendix C Table of Fresnel Integrals . . . 522
Appendix D Calculation of the Spectral Profile of a Line Broadened by Thermal Motions and Collisions . . . 524
Appendix E Mean Energy of an Oscillator in Cavity Radiation . . . 527

Literature Cited . . . **530**

Index . . . **535**
