

CONTENTS

1	Introduction	1
	Fundamental Concepts and Definitions	1
	Historical Development of Holography	2
	Summary of Holographic Applications	5
2	Types of Holograms and a Physical Description of Hologram Processes	7
	Fresnel Holograms	8
	Fraunhofer Holograms	9
	Side-Band Fresnel (Fraunhofer) Holograms	12
	Fourier-Transform Holograms	14
3	Mathematical Analysis of Hologram Processes	17
	Theory of Partial Coherence	18
	Green's Function Solution of Coupled Wave Equations	25
	Hologram Formation by Quasi-monochromatic Coherent Radiation	28
	Special Cases of Holography Using Quasi-monochromatic Coherent Radiation	30
4	Magnification Considerations for Hologram Systems Utilizing Quasi-monochromatic Coherent Radiation	67
	Magnification Obtained with Fresnel and Fraunhofer Holograms	68
	Magnification Obtained with Side-Band Fresnel Holograms	75
5	Film Effects and Resolution Limitations for Holographic Systems Utilizing Quasi-monochromatic Coherent Radiation	81
	General Treatment of Film Effects	81
	Film-Processing Effects	86
	Resolution Limitations	87

	Space-Band-Width Product	102
	Methods for Improving Resolution Capability	104
	Summary	110
6	Holography and Quasi-monochromatic Incoherent Radiation	111
7	Analysis of Hologram Formation	
	by Quasi-monochromatic Partially Coherent Radiation	115
	Effects of Spatial Coherence on Fraunhofer Holograms	115
	Effects of Temporal Coherence on Fraunhofer Holograms	122
	Effects of Different Media and Sources	126
8	Applications	129
	Holographic Microscopy	130
	Aberration Removal	146
	Optical Data Processing, Computing, and Data Storage and Retrieval	147
	Imaging Phase Distributions	161
	Photography	166
	Interferometry	170
	Removal of Random Phase Distortions	171
	Other Applications	174
	References	176
	Additional Reading	184
	Index	191
