I. THEORY OF OPTICAL PARAMETRIC AMPLIFICATION AND OSCILLATION

by W. BRUNNER and H. PAUL (Berlin, DDR)

1. INTRODUCTION	3
2. BASIC EQUATIONS	5
2.1 The anharmonic oscillator	5
2.2 Nonlinear susceptibilities	7
2.3 Field equations	10
2.4 Quantum mechanical description of parametric three-wave interaction	14
3. PARAMETRIC FLUORESCENCE	16
4. QUANTUM MECHANICAL DESCRIPTION OF PARAMETRIC AMPLIFICATION	20
5. CLASSICAL TREATMENT OF PARAMETRIC AMPLIFICATION	25
5.1 Solution of the equations of motion	25
5.2 Perfect phase matching ($\Delta k = 0$)	27
5.3 Phase mismatch ($\Delta k \neq 0$)	29
6. THE OPTICAL PARAMETRIC OSCILLATOR (OPO)	31
6.1 Introductory remarks	31
6.2 Tuning characteristics	32
6.3 The singly resonant OPO	35
6.4 The doubly resonant OPO	40
6.5 The triply resonant OPO	44
6.6 The internal OPO	48
6.7 The parametric approximation	50
7. RADIATION CHARACTERISTICS OF AN OPO	53
7.1 Buildup of oscillations	53
7.2 Quantum mechanical description of fluctuations	58
7.3 Evaluation of the line width	62
7.4 Amplitude fluctuations	64
8. EXPERIMENTAL WORK ON OPTICAL PARAMETRIC OSCILLATORS	66
8.1 Nonlinear crystals	66
8.2 Short survey of experimental results	67
8.3 Concluding remarks	72
ACKNOWLEDGEMENT	73
REFERENCES	73

II. OPTICAL PROPERTIES OF THIN METAL FILMS

by P. ROUARD (Marseille) and A. MEESSEN (Louvain)

1. ANOMALOUS OPTICAL ABSORPTION OF THIN METAL FILMS AND OF BULK ALKALI METALS	79
---	----

1.1 Introduction	79
1.2 Anomalies in the optical properties of thin metallic films and bulk metal	81
1.3 Anomalous optical absorption in discontinuous metals (very thin granular or porous films)	82
1.3.1 General	82
1.3.2 Principal results	83
1.4 Anomalous optical absorption in alkali metals	88
1.4.1 Introduction	88
1.4.2 Experimental data	89
1.4.3 Conclusions	106
2. EXCITATION OF COLLECTIVE OSCILLATIONS IN THIN METAL FILMS	108
2.1 Introduction	108
2.2 The dipole approximation	111
2.3 The optical size effect	116
2.4 Particle interactions and substrate effects	117
2.5 The plasma resonance absorption in thin granular metal films	121
2.6 Multipole effects	125
2.7 Excitation of plasma waves in continuous metal films	130
ACKNOWLEDGEMENT	133
REFERENCES	133

III. PROJECTION-TYPE HOLOGRAPHY

by T. OKOSHI (Tokyo)

1. INTRODUCTION	141
1.1 Technical background	141
1.2 Historical description of the development of projection-type holography	142
1.3 Purpose of this paper	143
2. INFORMATION THEORY OF THREE-DIMENSIONAL IMAGES	144
2.1 Introduction	144
2.2 Basic concepts	144
2.2.1 Information quantity and sampling point number	144
2.2.2 Visual field and viewing zone	145
2.2.3 Close imaging and remote imaging	145
2.3 Computation of sampling point number in three-dimensional images	146
2.3.1 Case of a two-dimensional object	146
2.3.2 Case of a three-dimensional object (I)	149
2.3.3 Case of a three-dimensional object (II)	151
2.3.4 Case of a three-dimensional object (III)	152
2.4 Information reduction of three-dimensional images by discarding vertical parallax	153
2.5 Promising directions of the development in the future	154
2.5.1 Various approaches toward unidirectional holography	154
2.5.2 Horizontal direction-selective screen	154
2.5.3 Projection-type holography	155
3. PROJECTION-TYPE UNIDIRECTIONAL HOLOGRAPHY	155
3.1 Introduction	155
3.2 Principle	156
3.3 Limitation of information reduction in the vertical direction	156
3.4 Optimum hologram height	157
3.5 Limitation of information reduction in the horizontal direction	159

3.6 Experiment of a projection-type unidirectional holography using a strip-shaped hologram	159
3.7 Experiment of a projection-type unidirectional holography using a horizontally sampled hologram	159
3.8 Experiment of a three-dimensional movie using a horizontally sampled hologram	161
4. WIDE-VIEWING-ZONE PROJECTION-TYPE UNIDIRECTIONAL HOLOGRAPHY	162
4.1 Introduction	162
4.2 Principle	163
4.3 Design theory	164
4.3.1 Arrangement of mirrors	164
4.3.2 Necessary hologram width	165
4.3.3 Optimum hologram height	166
4.3.4 Optimum design of mirror array	166
4.4 Experiments	168
4.4.1 Experimental setup	168
4.4.2 Hologram recording	169
4.4.3 Reconstruction of image	169
4.5 Possible versions	169
4.5.1 Projection-type image holography	169
4.5.2 Projection-type multiple-image holography	171
4.5.3 Projection-type Fourier-transform holography	172
5. PROJECTION-TYPE THREE-DIMENSIONAL IMAGING FROM A HOLOGRAM ILLUMINATED BY WHITE LIGHT	172
5.1 Introduction	172
5.2 Principle	173
5.3 Theory	175
5.3.1 Optical systems for recording and reconstruction	175
5.3.2 Design of the optical arrangement for recording and reconstruction	177
5.3.3 Hologram height	178
5.4 Experiment	178
5.4.1 Design of optical systems	178
5.4.2 Shape of the reconstructed image and the color dispersion	179
5.5 Discussion	180
6. PROJECTION-TYPE THREE-DIMENSIONAL IMAGING FROM AN IMAGE HOLOGRAM	180
6.1 Introduction	180
6.2 Projection-type image holography	181
6.3 Projection-type holographic stereogram	182
6.4 Projection-type image holography using an anamorphic lens system	183
6.5 Conclusion	184
ACKNOWLEDGMENT	184
REFERENCES	184

IV. QUASI-OPTICAL TECHNIQUES OF RADIO ASTRONOMY

by T. W. COLE (Epping, Australia)

1. INTRODUCTION	189
2. A FOURIER APPROACH TO ANTENNAS	191
3. THE REFLECTOR ANTENNA	192
3.1 The parabolic reflector	193
3.2 Spherical reflectors	196
3.3 Special reflectors and antennas	197
4. ARRAYS	199
4.1 The continuous and grating arrays	200

4.2 The dilute array	201
5. THE CULGOORA ARRAY	203
5.1 Design and performance	203
5.2 J^2 -synthesis	204
5.3 Image formation	206
5.4 The Culgoora paradox	207
6. STRIP SCAN SYNTHESIS	207
6.1 Reconstruction from strip scans	209
6.2 Lunar occultation	211
7. RADIO INTERFEROMETERS AND APERTURE SYNTHESIS	212
7.1 Radio interferometers	213
7.2 Aperture synthesis	214
8. EARTH ROTATION APERTURE SYNTHESIS	216
8.1 The geometry and antenna transfer function	218
8.2 The transformation and calibration procedures	220
8.3 Polarization synthesis	221
9. RADIO SPECTROSCOPY	221
9.1 The dynamic radio spectrograph	222
9.2 The filter bank receiver	223
9.3 The acousto-optical radio spectrograph	223
9.4 The autocorrelation spectrometer	224
10. SPECTRAL SYNTHESIS – A UNIFIED COHERENCE THEORY	225
11. SCINTILLATION, THE LIMIT TO RADIO IMAGING	228
12. OPTICAL ANALOGUE PROCESSING	231
12.1 The coherent optical processor	231
12.2 The optical imaging array processor	232
12.3 The spatial frequency plane and the Fourier transform hologram	234
12.4 Strip scan synthesis by back projection	235
13. IMAGE PROCESSING AND DISPLAY	235
13.1 Non-linear techniques	236
13.2 The effects of errors	238
14. CONCLUSIONS	239
ACKNOWLEDGEMENTS	241
REFERENCES	241

V. FOUNDATIONS OF THE MACROSCOPIC ELECTROMAGNETIC THEORY OF DIELECTRIC MEDIA

by J. VAN KRANENDONK and J. E. SIPE (Toronto, Ontario)

1. INTRODUCTION	247
1.1 The Maxwell equations	247
1.2 The constitutive relations and other macroscopic laws	249
1.3 Saltus conditions and additional boundary conditions	253
2. THE LORENTZ PROGRAM	254
2.1 The work of Lorentz in molecular optics	255
2.2 Historical developments and outline of the present review	259
3. MACROSCOPIC VARIABLES AND AVERAGING PROCEDURES	261
3.1 Fluids and ensemble averaging	262
3.2 Solids and spatial averaging	270
4. SOME USEFUL MATHEMATICAL THEOREMS	274
4.1 Lemmas on the differentiation of certain spatial integrals	274
4.2 Constitutive relations, integral relations and the extinction theorem	280

5. THE BASIC EQUATIONS FOR THE MOLECULAR CHARGE DISTRIBUTIONS AND THE MICROSCOPIC FIELDS	285
5.1 Radiation damping and the molecular polarizability	285
5.2 Some properties of the electric dipole field	288
5.3 The microscopic equations of motion of molecular optics	292
6. PLANCK'S THEORY OF DISPERSION	295
6.1 From the introduction to Planck's paper	295
6.2 Planck's derivation of an expression for the local field	298
6.3 Comments on Planck's derivation and correction of the damping term	303
7. HOEK'S DERIVATION OF THE MACROSCOPIC EQUATIONS	307
7.1 Formulation of the problem and outline of the methods of solution	308
7.2 Derivation of the macroscopic equations	312
7.3 The integral equation for the average polarization, the Lorentz-Lorenz relation, and the extinction theorem	317
7.4 Radiation damping and density variations	321
7.5 Comments on Hoek's analysis, and improved derivations	324
8. PROPAGATION OF LIGHT IN CRYSTALLINE DIELECTRICS	327
8.1 Derivation of the constitutive relation	328
8.2 The Lorentz-Lorenz relation and the range of validity of the macroscopic equations	336
9. PROPAGATION OF LIGHT IN AMORPHOUS DIELECTRICS	338
9.1 Derivation of the constitutive relation	339
9.2 Concluding remarks	346
