

CONTENTS

PREFACE	v
INTRODUCTION	vii
.	
I. PRODUCTION OF X-RAYS	1
1. X-ray tubes for analysis of primary spectrum	1
2. The production of X-ray beams in gases	20
3. The production of secondary X-ray spectra	23
II. AUXILIARY APPARATUS	31
1. Sources of power supply	31
2. Measurement of high voltage	51
3. Obtaining high vacuum and vacuum canalisation	56
4. High vacuum measurements	62
III. MEASUREMENT OF INTENSITY OF X-RAY BEAMS	66
1. Photographic registration	66
<i>a)</i> General information, <i>b)</i> Photodensity, <i>c)</i> Densitometric characteristic, <i>d)</i> The determination of relative intensity of lines, <i>e)</i> Conditional photodensity, <i>f)</i> P-function, <i>g)</i> The choice of optimum exposure, <i>h)</i> Practical indications.	
2. Registration by ionisation	104
<i>a)</i> General information, <i>b)</i> Ionisation cham-	

ber, *c*) Proportional amplifier, *d*) Proportional counter, *e*) Geiger counter.

3. Scintillation counter	147
4. Other methods of registering X-rays	159
<i>a</i>) Direct registration by photomultiplier,	
<i>b</i>) Crystal counter, <i>c</i>) Photoelements, <i>d</i>) Calorimetric methods.	
5. The statistical basis for measuring the intensity	168
6. The application of monitors	183
IV. ANALYSIS OF X-RAY SPECTRA	198
1. Methods for analysis of X-ray spectra	198
<i>a</i>) The flat crystal methods : Bragg's method ; Soller's method, <i>b</i>) Methods of vertical focusing : The Hamos method ; Kunzl method, <i>c</i>) Methods of horizontal focusing : Johann's method ; Johansson's method ; Cauchois methods ; Du-Monde's method, <i>d</i>) Crystals for spectrographs.	
2. The construction of X-ray spectrographs	241
<i>a</i>) Spectrograph with flat crystals : Krasnikov's spectrograph ; The spectrometer of Friedman and Birks, <i>b</i>) Photographic spectrographs with horizontal focusing : Short wave spectrographs RSK-3 ; Short wave spectrograph KRS ; Long wave spectrograph of Borisov and Vogel ; Long wave X-ray spectrograph DRS ; Long wave X-ray spectrograph RSD-2 ; Long wave focusing tube spectrometer ; Long wave focusing tube spectrograph by Borisov ; Long wave spectrograph of Morley, <i>c</i>) Ionisation spectrometers with horizontal focusing : The universal	

short wave X-ray spectrometer KRUS ; Short wave universal X-ray spectrometer RSK-4 ; Short wave X-ray spectrometer of Birks and Brooks ; The spectrometer for extremely short X-rays ; The short wave spectrometer by Du-Monde ; The long wave X-ray universal spectrometer DRUS ; Long wave focusing spectrometer of Olin ; Long wave large focusing spectrometer of Sandstrom, *d*) Quantometry, *e*) X-ray microanalysers.

V. EXPERIMENTAL RESULTS 306

1. The construction of the forms of emission spectra 306
 - a*) Determination of the photon energy, *b*) Determination of relative intensity.
2. The construction of the forms of absorption spectra 316
3. The distortion in the spectral forms 319
 - a*) Distortions due to the continuous recording,
 - b*) Distortion due to the apparatus : Column method ; The method of trigonometric series with symmetric distortion of the emission spectra ; Method of trigonometric series for symmetric distortion of the absorption spectra ; Finding the distortion forms in the general case ; The correction of the form of the emission spectra in the general case ; Correction of the forms of absorption spectra in the general case,
 - c*) Distortion due to the internal atomic levels.

VI. QUALITATIVE ANALYSIS 377

1. Determination of the composition of the test material 377
 - a*) Sensitivity of analysis and the region of its

application, . <i>b</i>) Obtaining and deciphering the spectrogram.	
2. Semi-quantitative analysis	392
VII. QUANTITATIVE ANALYSIS OF THE PRIMARY X-RAY SPECTRA	396
1. Method of internal standard	396
<i>a</i>) Theory of the method, <i>b</i>) Analysis of ores in homogeneous composition, <i>c</i>) The calculation of the necessary weighing, <i>d</i>) Special cases of analysis : Two neighbouring elements occur in the test material ; Analysis is carried out for all the basic components of the test material ; Analysis of small admixtures to the basic component.	
2. Method of external standard	412
VIII. QUANTITATIVE ANALYSIS WITH SECONDARY X-RAY SPECTRA	414
1. Mixing element	416
<i>a</i>) Method of external standard, <i>b</i>) Method of internal standard	
2. Analysis in the absence of mixing elements	421
<i>a</i>) The theoretical basis of the analysis of binary mixture, <i>b</i>) Analysis according to the method of external standard, <i>c</i>) Analysis with the method of internal standard, <i>d</i>) The comparison of the sensitivities of analysis with <i>K</i> - and <i>L</i> -series.	
3. Analysis in presence of one mixing element	437
<i>a</i>) The case of selective absorption, <i>b</i>) The case of selective excitation.	

4. Analysis in presence of several mixing elements	455
<i>a)</i> Theoretical basis of analysis of multicomponent test material, <i>b)</i> An example of analysis with multicomponent test material.	
5. Determination of the thickness of the cover	466
IX. ABSORPTION ANALYSIS	471
1. The determination of the element content with the help of discontinuing intensity in the neighbourhood of the absorption edge	471
<i>a)</i> Analysis with the help of continuous absorption spectra, <i>b)</i> Analysis of characteristic absorption spectra.	
2. The determination of the element content with the help of alteration in the intensity of absorption	480
<i>a)</i> The absolute method, <i>b)</i> The relative method.	
APPENDICES	493
I. Values of $k\pi/2$ and $k \cdot \text{si}(k\pi/2)$	495
II. Four-place tables of $\sin k\varphi$	496
III. Four-place tables of $\cos k\varphi$	509
IV. Natural widths γ_0 of the lines $k\alpha_1$ and $k\alpha_2$	515
V. Widths of K -level	516
VI. Widths of L_{II} - and L_{III} -levels.	516
