

VOLUME 2

<i>Contents</i>	xxvii
 PART IV. MOLECULAR SPECTROSCOPY	 473
<i>Course 6. Probing small molecules with lasers, by Jean-Claude Lehmann</i>	475
1. Experimental techniques	478
1.1. Assignment of the excited state quantum numbers	478
1.2. Hanle effect	481
1.3. Other experimental techniques	486
1.4. Conclusion	489
2. Optical pumping of molecules. Theory	489
2.1. General relations	489
2.2. The $\alpha_{m_1 m_2}$ operators	491
2.3. The T_q^k operators	493
2.4. Calculation of L_F	494

2.5. Polarization rates. Hanle effect	497
2.6. Semi-classical theory	504
3. Examples of molecular physics with lasers	513
3.1. Landé factors	513
3.2. Lifetimes and predissociations	517
4. Conclusions	526
References	526

*Course 7. Infrared and radiofrequency spectroscopy in the laser cavity,
by Takeshi Oka* 529

1. Introduction	531
1.1. Basic set-up	531
1.2. Energy level scheme	531
1.3. Molecules	533
2. Two-photon and multiphoton processes	534
2.1. Treatment by Schrödinger's equation	534
2.2. Interaction diagrams	539
2.3. Multiphoton processes	540
3. Observation of two-photon and multiphoton Lamb dips	542
4. Theory of two-photon and multiphoton Lamb dips	546
4.1. Equations of motion	547
4.2. Normal Lamb dips	549
4.3. Two-photon Lamb dips	551
4.4. Satellite dips	553
4.5. Multi-RF photon dips	555
4.6. Dressed atom formalism	556
5. Infrared-radiofrequency double resonance	558
5.1. Equations of motion	559
5.2. Rate equation approximation	560
5.3. Bulk susceptibility and double resonance	562
5.4. "Forbidden" rotational transitions	568
References	569

*Course 8. Applications of infrared lasers to spectroscopy,
by P.L. Kelley* 571

1. Introduction	573
-----------------	-----

2. Infrared laser sources	573
2.1. Ultrastable electrically excited gas lasers	573
2.2. Optically pumped molecular lasers	580
2.3. Tunable infrared lasers	582
3. Infrared detection	590
3.1. Direct detection	591
3.2. Heterodyne detection	593
3.3. n -frequency mixing	595
3.4. Opto-acoustic detection	597
4. Frequency calibration of molecular gas lasers	598
4.1. Beat frequency measurements of CO ₂ lasers and accurate determination of rotational constants	598
4.2. Molecular constants of CO by CO-CO ₂ harmonic and CO-CO mixing	600
4.3. Measurement of HF laser frequencies	602
5. Spectroscopic studies with tunable lasers	604
5.1. Carbon monoxide	604
5.2. Nitric oxide	604
5.3. Carbon dioxide	612
5.4. Water vapor	612
5.5. Sulfur dioxide	623
5.6. Monodeuterated ammonia	623
5.7. Methane	623
5.8. Sulfur hexafluoride	624
References	627
 <i>Course 9. Some molecular studies using lasers, by Ali Javan</i>	 637
1. Observation and collision width studies of Doppler-free resonances originating from kinetically hot molecules selected from a room temperature gas	640
2. Optical adiabatic rapid passage utilizing narrow infrared saturation resonances	652
3. Anomalous Zeeman effect in $^1\Sigma$ molecules: CO ₂ and N ₂ O; utilization of Doppler-free SWSR resonances over entire rotational-vibrational band	663
3.1. Introduction	663
3.2. Physical origin of the narrow dip in fluorescence	664
3.3. Standing wave field interacting with a two-level system; rate equation approach	670
3.4. Magnetic effects in $^1\Sigma$ molecules	680
3.5. "Crossover" saturation resonances	685
3.6. Experimental observation of the anomalous Zeeman effect in $^1\Sigma$ CO ₂ and N ₂ O molecules using SWSR	687
References	694

<i>Seminar 6. Wavelength comparison between lasers, by Jean-Pierre Monchalín</i>	695
 PART V. NEW APPLICATIONS AND ADVANCES IN THE LASER FIELD	 713
 <i>Course 10. Laser and nuclear spectroscopy “crossing”, by Vladilen S. Letokhov</i>	 715
1. Introduction. Basic ideas	717
2. Vibrational-nuclear transitions in a molecule	721
2.1. Classical model	721
2.2. Quantum formulation of the problem	723
2.3. Probabilities of γ -transitions in an unexcited molecule	726
2.4. Probabilities of γ -transitions in an excited molecule	731
2.5. Structure of narrow γ -resonances induced by a laser wave	733
2.6. Effect of vibrational anharmonicity and of vibrational-rotation interaction	737
2.7. Vibrational-nuclear γ -transitions in $^{188}\text{OsO}_4$ and experimental possibilities	740
3. Electron-nuclear transitions in atoms	748
3.1. Probabilities of electron-nuclear transitions	748
3.2. Narrow electron-nuclear γ -lines induced by laser radiation	751
4. Spectrum of nuclear γ -transitions in diatomic molecules	754
4.1. Electron-nuclear transitions	755
4.2. Vibrational-nuclear transitions	756
4.3. Rotational-nuclear transitions	756
4.4. Recoil energy for different degrees of freedom	758
5. Narrowing and frequency tuning of positronium annihilation line	759
5.1. Velocity-selective ortho-para-positronium conversion	759
5.2. Experimental possibilities	763
6. Conclusion	766
6.1. Prospects of laser-nuclear spectroscopy	766
6.2. Reverse approach	768
References	769
 <i>Course 11. Principles of laser isotope separation, by Vladilen S. Letokhov</i>	 771
1. Introduction. Classification of methods	773
1.1. Laser substance separation at the atomic-molecular level	773
1.2. Classification of laser separation methods. History	775
1.3. Conditions required for separation selectivity	778

1.4. Comparison between photophysical and photochemical methods	781
1.5. Essential properties of laser radiation	784
2. Isotopic effect and selective excitation	784
2.1. Atomic spectra	785
2.2. Molecular spectra	787
2.3. Methods of excitation selectivity enhancement	789
3. Photophysical methods of isotope separation	791
3.1. Selective atomic photoionisation	791
3.2. Selective two-step molecular photodissociation	810
3.3. Selective molecular photopredissociation	816
3.4. Selective molecular dissociation by a strong IR field	826
4. Photochemical methods of isotope separation	847
4.1. Selective electron photochemistry of atoms and molecules	847
4.2. Selective vibrational molecular photochemistry	852
5. Other applications of selective laser photophysics	856
5.1. Production of pure substances	857
5.2. Nuclear isomer separation for γ -lasers	860
5.3. Selective detection of single atoms and molecules	862
References	865
