Preface to First English edition	ix
Preface	xi
1. Historical review	1
2. Properties of light: interaction between light and matter	4
2.1. Modes of black-body radiation	4
2.2. Modes in reflecting volumes	8
2.3. Coherence and noise	10
2.4. Radiative energy exchange	12
2.5. Absorption and amplification by stimulated transitions . .	18
2.6. Spontaneous emission as a source of noise	23
3. Production of inversion	28
3.1. Inversion methods	28
3.2. The three-level method	28
3.3. The optical three-level system	32
3.4. The optical four-level system	34
3.5. Two-boson lasers	37
4. Practical methods of inversion and typical laser materials. . .	39
4.1. Optically pumped lasers	39
4.2. Gas-discharge lasers	49
4.3. Semiconductor lasers	62
5. Laser amplifiers and non-resonant oscillators	67
5.1. Travelling-wave amplifiers	67
5.2. Saturation of the travelling-wave amplifier	75
5.3. Background noise of the travelling-wave amplifier; non- resonant oscillators (super-radiators)	79
5.4. Types of travelling-wave amplifiers	88
5.5. Regenerative resonance amplifiers	90
6. The laser oscillator	100
6.1. Oscillation threshold	100
6.2. The laser-oscillator as a saturated regenerative noise amplifier	106
7. Effects leading to multi-mode oscillations	120
7.1. Saturation of homogeneously and inhomogeneously broad- ened lines	120
7.2. Multi-mode oscillators with inhomogeneous line broad- ening	124

7.3. Spatially concentrated inversion saturation with homogeneously broadened lines	129
7.4. Effects with semiconductor lasers	132
8. Optical resonators—mode selection effects of the first order . .	135
8.1. Open and closed resonators	135
8.2. Diffusion losses; open resonator	135
8.3. Laser-oscillators with closed resonators	138
8.4. Unwanted, totally reflected modes in Fabry-Perot lasers .	142
8.5. Fibre lasers	145
9. Eigenmodes of open, optical resonators	147
9.1. Diffraction loss from open resonators	147
9.2. Mathematical formulation as an eigenvalue problem; iteration solutions	150
9.3. Transverse modes of the plane Fabry-Perot resonator . .	154
9.4. Diffraction losses and resonant frequencies of different modes; mode selection.	156
9.5. Model and approximate calculation of the transverse modes of a plane resonator.	161
9.6. Degenerate modes—mode patterns of the plane resonator .	176
9.7. Mode selection with small line width; effect of mirror defects	178
9.8. The concentric and hemiconcentric resonator	181
9.9. General confocal resonators	184
9.10. Limited mode cross section of the general confocal resonator	187
9.11. Caustic curves of the confocal resonator.	190
9.12. Eigenfunctions of confocal resonators ($r=1$)	194
9.13. The general confocal resonator ($r\neq 1$)	203
9.14. Spot size, mode volume, and mode selection of different resonators	204
9.15. Practical resonator designs	208
9.16. Other resonators	217
9.17. Radiation from optical resonators and alignment of various resonators	217
10. Enhancement of mode selection in optical resonators	221
10.1. Necessity for higher mode selection	221
10.2. Accentuation of individual lines	221
10.3. Transverse mode selection	223
10.4. Axial mode selection.	234
10.5. Coupled axial and transverse selection	242
10.6. Elimination of causes for multi-moding	244
10.7. Oscillator amplifier	249

11. Oscillator output power and optimum coupling	251
11.1. Output power, taking losses into account	251
11.2. Optimum decoupling	256
11.3. Decoupling of high-power solid-state lasers	263
11.4. Measurement of output power	265
11.5. Additional effects; decoupling methods	267
12. Time dependence of the emission and relaxation oscillations in laser oscillators.	272
12.1. General development of emission in pulsed lasers . . .	272
12.2. Relaxation oscillations	278
12.3. Rate equations	284
12.4. Equilibrium values	289
12.5. Linear approximation of the rate equations	291
12.6. Numerical solutions of the rate equations	299
12.7. Lasers with external mirrors	303
12.8. Interaction between modes; irregular and undamped relaxation oscillations	305
12.9. Analysis of the transient behaviour of a confocal ruby laser.	322
12.10. Single pulses	329
12.11. Possibilities of compensating for line drift	333
13. Giant-pulse lasers: laser-modulation	338
13.1. Properties of giant-pulse lasers	338
13.2. Giant-pulse lasers with slow switching	347
13.3. High-speed polarisation switches	354
13.4. Saturable absorbers as high-speed switches	356
13.5. Special designs; combination with amplifiers	374
13.6. Emission stabilisation by modulation of the resonator mirrors	377
13.7. Modulation of the laser emission with the pump power. .	379
14. Optical pumping systems	383
14.1. General rules	383
14.2. Light sources	387
14.3. Distribution of the pump light in the laser material . . .	406
14.4. Homogeneous illumination with helical flash tubes . . .	417
14.5. Focal projection illumination in elliptical cylindrical mirrors	421
14.6. Non-focal elliptical cylinders and circular cylindrical mirrors	437
14.7. Exfocal ellipsoidal arrangement	440
14.8. Condenser arrangements	449

14.9. Other pumping arrangements	450
14.10. Determination of the material volume	452
15. Application of lasers	456
15.1. Assessment of applicability	456
15.2. Information transmission with laser beams; Light modulation	459
15.3. Demodulation and photomixing	463
15.4. Transmission of laser light	468
15.5. Laser radar	470
15.6. Ionisation and material processing in the focused laser beam	471
15.7. Application to precision measurements and plasma diagnostics	475
15.8. Various experiments with laser beams	476
15.9. Lasers as logic elements	478
15.10. The laser as a pump source for multi-quantum processes—non-linear optics.	481
16. Survey of known laser materials	488
Table 16.1. Laser transitions in gases	499
Table 16.2. Laser transitions in dielectric solids and liquids	554a
Table 16.3. Semiconductor lasers	555
Bibliography	558
References	560
Index	747
