CONTENTS

PREFACE	to Volume 2	vii
6. Magnetostatics		197
6.1	Introduction	197
6.2	Origin of the magnetic field	198
6.3	The magnetic displacement vector	203
6.4	Boundary conditions	216
6.5	The magnetostatic scalar potential	221
6.6	Small magnets	224
6.7	Inductance	229
7. Magnetization		243
7.1	Permanent magnets	243
7.2	Permeable media	255
7.3	Induced magnetization	256
7.4	Hysteresis	258
8. Potential Problems		263
8.1	Fundamental theorems and techniques	263
8.2	The method of images	270
8.3	Three-dimensional problems with axial symmetry	284
8.4	Two-dimensional problems	298
8.5	Gravitation	316
9. Electromagnetic Induction and Magnetic Energy		332
9.1	Faraday's and Neumann's Law	332
9.2	Observers in motion: the Lorentz transformation	336
9.3	The Lorentz transformation of field quantities	351

CONTENTS

9.4	The Lorentz force on a moving charge	356
9.5	Non-steady currents	365
9.6	Initial conditions: switching	374
9.7	Quasi-steady currents	387
9.8	Magnetic energy and forces	399
9 . 9	Dissipation of energy by quasi-steady currents	406
10. The	Displacement Current and Maxwell's Equations	417
10.1	The displacement current	417
10.2	2 Electromagnetic radiation	419
10.3	Boundary conditions at discontinuities	421
10.4	Poynting's vector	425
10.5	5 Maxwell's stress tensor and electromagnetic momentum	430
Answer	s to the Exercises	435
