

# CONTENTS

<b>Chapter One:</b>	<b>Introduction to Fields and Field Theory</b>	1
1.1.	Types of Fields	2
1.2.	Typical Field Behavior	2
1.2.1.	The Field Approach – A Temperature Field Example	3
1.3.	Electromagnetic Fields, Energy, and Waves – A Preview	7
<b>Chapter Two:</b>	<b>Electromagnetic Field Laws in Free Space</b>	10
2.1.	Basic Postulates and Definitions	11
2.2.	Charge Density and Current Density	14
2.3.	Postulate IV – The Field Equations in Free Space	16
2.3.1.	Line, Surface, and Volume Integrals	19
2.3.2.	The Physical Significance of the Field Equations	24
2.4.	Applications of the Integral Field Laws	28
2.4.1.	The Point-Charge Field	28
2.4.2.	A Line of Charge	30
2.4.3.	A Line of Current	32
2.5.	Summary and Conclusions	34
2.6.	Selected References	35
	Problems	36
<b>Chapter Three:</b>	<b>Vector Analysis</b>	41
3.1.	Scalars and Vectors	41
3.2.	Vector Addition and Subtraction	42
3.3.	Orthogonal Coordinate Systems	43
3.3.1.	Cartesian Coordinates	45
3.3.2.	Circular-Cylindrical Coordinates	46
3.3.3.	Spherical Coordinates	49
3.4.	The Scalar or Dot Product	52
3.5.	The Vector or Cross Product	55

3.6.	Line, Surface, and Volume Integration	59
3.6.1.	Differential Lengths, Surfaces, and Volumes	60
3.6.2.	Evaluation of Line Integrals	65
3.6.3.	Evaluation of Surface Integrals	71
3.6.4.	Evaluation of Volume Integrals	74
3.7.	The Gradient and the Directional Derivative of a Scalar Field	76
3.7.1.	Definition of the Gradient	76
3.7.2.	Examples and Properties of the Gradient	79
3.7.3.	Evaluation of the Gradient	82
3.8.	The Divergence and Gauss' Theorem	85
3.8.1.	Definition and Evaluation	85
3.8.2.	Properties and Examples of the Divergence	92
3.8.3.	Gauss' Theorem	93
3.9.	The Curl and Stokes' Theorem	95
3.9.1.	Definition and Evaluation	95
3.9.2.	Physical Properties of the Curl – The Curl Meter	102
3.9.3.	Mathematical Properties of the Curl-Stokes' Theorem	106
3.10.	Summary and Conclusions	109
3.11.	Selected References	111
	Problems	111
<b>Chapter Four: The Differential Field Laws</b>		115
4.1.	The Differential Field Laws in Free Space	115
4.1.1.	The Divergence Relations	116
4.1.2.	The Curl Relations – Maxwell's Equations	117
4.1.3.	The Significance of the Differential Field Laws	118
4.2.	Surface Charge Density and Surface Current Density	119
4.3.	Boundary Conditions	122
4.3.1.	Discontinuities in the Normal Components	123
4.3.2.	Tangential Field Components	126
4.3.3.	The Significance of the Boundary Conditions	127
4.4.	Some Direct Applications of the Differential Laws	128
4.4.1.	A Spherical Cloud of Charge	128
4.4.2.	Shell of Charge	131
4.4.3.	Cylinder of Current	134
4.4.4.	Shell of Current	137
4.5.	Electromagnetic Fields in Conductors	140

4.5.1. The Macroscopic Model of Conducting Material	140
4.5.2. The Differential Laws in Conductors	141
4.6. Preview of the “Field Approach”—Some Mathematically Acceptable Static Fields	142
4.6.1. The Point-Charge Field	143
4.6.2. A Uniform <b>E</b> Field	145
4.6.3. A Uniform <b>H</b> Field	146
4.7. Summary and Conclusions	147
Problems	148
<b>Chapter Five: Static Fields I</b>	153
5.1. The Static Field Laws	154
5.2. Electrostatic Fields	155
5.2.1. The Coulomb Field of Known Stationary Charges	155
5.2.2. Examples of Static <b>E</b> Fields	159
5.2.2.1. An Electric Dipole	159
5.2.2.2. A Ring of Charge	162
5.2.2.3. A Semicircular Ring of Charge	165
5.3. The Differential Equations for the Scalar Potential	167
5.3.1. Poisson’s Equation and Laplace’s Equation	167
5.3.2. The Particular Solution of Poisson’s Equation	169
5.3.3. The Need for a Homogeneous Solution	170
5.4. Physical Properties of Laplace’s Equation	172
5.4.1. A Wire Grid Analog	172
5.4.2. An Elastic Membrane Analog	175
5.5. Mathematical Properties of Laplace’s Equation	179
5.5.1. A Maximum-Minimum Theorem	179
5.5.2. The Uniqueness Theorem	179
5.6. Solutions of Laplace’s Equation in Rectangular Coordinates	182
5.6.1. Trivial Solutions	183
5.6.2. General Solutions	184
5.6.3. Two-Dimensional Solutions	187
5.7. Examples of Electrostatic Fields in Cartesian Coordinates	187
5.7.1. A Parallel-Plate Capacitor	188
5.7.2. A Rectangular Model of a Resistor	192
5.7.3. A Rectangular Conducting Sheet	196
5.7.4. A Rectangular Air Slot	202

5.7.4.1. Sinusoidal Excitation	205
5.7.4.2. Uniform Excitation	208
5.7.4.3. Arbitrary Excitation	213
5.8. Summary and Conclusions	213
Problems	215
<b>Chapter Six: Static Fields II</b>	<b>223</b>
6.1. Two-Dimensional Solutions of Laplace's Equation in Cylindrical Coordinates	223
6.1.1. Trivial Solutions	224
6.1.2. General Solutions	226
6.2. Solutions of Laplace's Equation in Spherical Coordinates	231
6.2.1. Trivial Solutions	232
6.2.2. General Solutions	233
6.3. Summary of the Solutions of Laplace's Equation	236
6.4. Electrostatic Field Examples	237
6.4.1. Electric Dipole Within a Conducting Sphere	237
6.4.1.1. Uncharged Shell	238
6.4.1.2. Charged Shell	243
6.4.1.3. Arbitrary Charge Distribution Within the Shell	246
6.4.2. A Conducting Sphere in a Uniform Field	249
6.4.3. A Conducting Cylinder in a Uniform Current	254
6.4.3.1. Case A: $\sigma_1 = \sigma_2$	257
6.4.3.2. Case B: $\sigma_2 = 0$ ( $\sigma_1 > 0$ )	257
6.4.3.3. Case C: $\sigma_2 = \infty$ ( $0 < \sigma_1 < \infty$ )	260
6.4.3.4. Case D: General Values of $\sigma_1$ and $\sigma_2$	263
6.4.4. A Circular Resistor with Fringing	264
6.4.4.1. The Field in the Conductor and the Source	264
6.4.4.2. The Outside (Fringing) Field	266
6.5. Static Magnetic Fields	270
6.5.1. The Magnetic Vector Potential	271
6.5.2. The Magnetic Field of Known Fixed Currents	272
6.6. The Scalar Magnetic Potential	275
6.6.1. Currents Within V' – the Particular Solution	276
6.6.2. The Homogeneous Solution and the Scalar Magnetic Potential	276

6.6.3. Boundary Conditions and Uniqueness	277
6.7. Examples of Static <b>H</b> Fields	278
6.7.1. A Single-Turn Inductor	278
6.7.2. A Spherical Coil	280
6.8. Dipole Layer Analog of Static Current Loops	287
6.8.1. A Single-Turn Current Loop	288
6.8.2. The Dipole Layer Analog	291
6.8.3. A Current Loop Dipole Field	294
6.8.4. A Closely Wound Solenoid	297
6.9. Far-Field Potentials and the Multipole Expansion	303
6.9.1. The Zero-Order Approximation	304
6.9.2. Higher Order Approximations	305
6.9.3. The Multipole Expansion	308
6.10. Summary and Conclusions	314
6.11. Selected References	316
Problems	317
<b>Chapter Seven: Macroscopic Fields in Matter</b>	326
7.1. Microscopic and Macroscopic Fields in Matter	326
7.2. The Macroscopic Model of Polarized Matter	327
7.2.1. The Mechanics of Polarization	328
7.2.2. Polarization Density	330
7.2.3. Polarization Charge Density and Current Density (Volume Effects)	331
7.2.4. Polarization Surface Effects	334
7.3. The Electromagnetic Field Laws in Dielectric Material	336
7.3.1. The <b>E-P</b> Form of the Field Laws in Polarized Matter	336
7.3.2. The <b>E-D</b> Form of the Field Laws in Matter	338
7.4. Examples of Permanently Polarized Bodies	340
7.4.1. A Permanently Polarized Slab	340
7.4.1.1. Case 1: Uniform Polarization	340
7.4.1.2. Case 2: Nonuniform Polarization	343
7.4.2. A Permanently Polarized Block	346
7.4.3. A Uniformly Polarized Sphere	349
7.5. Examples of Systems With Specified Permittivity $\epsilon$	355
7.5.1. A Sphere of Uniform Permittivity in a Uniform Field	355
7.5.2. A Parallel-Plate Capacitor Filled with a Uniform $\epsilon$ Material	360
7.5.3. A Parallel-Plate Capacitor Filled with Nonuniform $\epsilon$ Material	364

7.5.4. A Parallel-Plate Capacitor with Layers of Dielectric Slabs	368
7.6. The Macroscopic Model of Magnetized Matter	370
7.6.1. The Physical Basis of Magnetism	370
7.6.2. The Magnetization Vector	372
7.7. The Amperian-Current Model	372
7.7.1. The Amperian-Current Density	373
7.7.2. The Amperian-Current Form of the Field Laws in Matter	376
7.8. The Magnetic-Charge Model	377
7.8.1. The Concept of Magnetic Charge	377
7.8.2. Magnetic Charge and Magnetic-Charge Density	378
7.9. The <b>B</b> - <b>D</b> Form of the Field Laws in Matter	382
7.10. An Example of the Fields in Magnetic Material	385
7.10.1. A Permanently Magnetized Cylinder	385
7.10.1.1. Use of Amperian-Current Model	385
7.10.1.2. Use of Magnetic-Charge Model	388
7.11. The Constituent Relations	392
7.12. Summary and Conclusions	396
7.13. Selected References	398
Problems	398
<b>Chapter Eight: Electromagnetic Energy and Power</b>	404
8.1. Electromagnetic Force on Moving Charges	404
8.2. Power Supplied to Moving Charges	405
8.3. Conservation of Energy – Poynting’s Theorem	407
8.3.1. Differential Form of Poynting’s Theorem	407
8.3.2. Integral Form of Poynting’s Theorem	410
8.3.3. Some Difficulties in the Identification of $S$ and $w$	411
8.4. The Energy Stored in Electric and Magnetic Fields	412
8.4.1. Electric Energy Stored in an Air-Filled Capacitor	413
8.4.2. Magnetic Energy Stored in an Air-Filled Inductor	414
8.5. Power Absorbed by Matter	416
8.5.1. Polarization, Magnetization, and Conduction Power Densities	416
8.5.2. Poynting’s Theorem in Matter	418
8.6. Static Power Flow and Dissipation	421

8.6.1. Static Power Flow in a Resistor	422
8.6.1.1. The Static <b>E</b> and <b>H</b> Fields	423
8.6.1.2. Poynting's Vector and Power Flow	426
8.6.2. The Static Power Flow in a Rectangular Resistor	428
8.6.2.1. Resistor with Battery at Infinity	428
8.6.2.2. Resistor with Battery Distributed Along One Edge	431
8.6.3. The Static Power Flow in an Electron Beam	434
8.6.3.1. Dynamics of the Electron Beam	434
8.6.3.2. The Static <b>E</b> and <b>H</b> Fields	437
8.6.3.3. Poynting's Vector and the Static Power	439
8.7. Polarization Energy and Electric Energy	441
8.7.1. The Polarization Energy Density	441
8.7.2. The Electric Energy Density	444
8.7.3. Total Electric Energy	445
8.7.4. Examples of Stored Electric Energy – an $\epsilon$ Filled Capacitor	446
8.8. Magnetization Energy and Magnetic Energy	448
8.8.1. The Magnetization Energy Density	448
8.8.2. The Magnetic Energy Density	449
8.8.3. Total Magnetic Energy	450
8.8.4. Examples of Stored Magnetic Energy	451
8.8.4.1. A Single-Turn Inductor	451
8.8.4.2. A General $n$ -Turn Inductor Coil	453
8.9. Summary and Conclusions	455
8.10. Selected References	457
Problems	458
<b>Chapter Nine: Time-Varying Fields—Low-Frequency Behavior</b>	462
9.1. The Basic Field Laws	462
9.2. Static Versus Time-Varying Fields	464
9.2.1. <b>E</b> and <b>H</b> Field Coupling	464
9.2.2. The Physical Significance of Low-Frequency Fields	465
9.3. An Exact Wave Solution	467
9.3.1. A Simple Wave System	467
9.3.2. One-Dimensional Wave Equations	468
9.3.3. Sinusoidal Steady-State Solutions	470
9.3.4. The Time-Varying Capacitor Field	472
9.3.5. The Low-Frequency Response	474
9.4. A Power Series Approach to Time-Varying Fields	480

9.4.1. General Field Dependence on Frequency	481
9.4.2. The Power Series in $\omega$	482
9.4.3. The Power Series Without $\omega$	488
9.5. Examples of Quasi-Static Fields – The Low-Frequency Response of a Capacitor	490
9.5.1. A Parallel-Plate Capacitor	490
9.5.1.1. Reference Choice	490
9.5.1.2. The Zero-Order Field	492
9.5.1.3. The First-Order Field	495
9.5.1.4. The Quasi-Static Solution	498
9.5.1.5. Second-Order Fields and the Validity of Quasi_Statics	500
9.5.1.6. Third-Order Fields and Beyond	505
9.6. The Low-Frequency Response of Inductors	506
9.6.1. A Single-Turn Inductor	507
9.6.1.1. The Zero-Order Field	507
9.6.1.2. The First-Order Field	508
9.6.1.3. The Quasi-Static Response	509
9.6.1.4. EMF and Lenz's Law	512
9.6.1.5. Second-Order Fields and Beyond	515
9.6.2. An $N$ -Turn Coil	517
9.6.2.1. The Quasi-Static Field Without the Coil	518
9.6.2.2. The Quasi-Static Field with the Coil	519
9.6.2.3. The Physical Significance of the Conservative $\mathbf{E}'(t)$ Field	525
9.6.2.4. A Self-Excited $N$ -Turn Coil	528
9.7. The Frequency Response of a Resistor	529
9.7.1. The Zero-Order Fields	530
9.7.2. The First-Order Fields	532
9.7.3. The Quasi-Static Response	532
9.8. Circuit Theory as a Quasi-Static Approximation	536
9.8.1. Kirchhoff's Circuit Laws from Field Theory	537
9.8.2. The Circuit Concept of Power	540
9.9. Summary and Conclusions	543
Problems	544
<b>Chapter Ten: TEM Fields and Waves (Lossless Transmission Line Theory)</b>	<b>548</b>
10.1. Transverse Electromagnetic (TEM) Fields	548
10.1.1. TEM Field Laws	549
10.1.2. TEM Structures – Perfectly Conducting Transmission Lines	550
10.1.3. TEM Boundary Conditions on Perfectly Conducting Lines	551

10.2.	The Transmission Line Model	552
10.2.1.	Voltage and Current Definitions	553
10.2.2.	Normalized Transverse Fields	554
10.2.3.	The Transmission Line Equations	556
10.2.4.	Transmission Line Parameters	557
10.2.4.1.	Capacitance per Unit Length	557
10.2.4.2.	Inductance per Unit Length	558
10.2.4.3.	Shunt Conductance per Unit Length	559
10.3.	The Transmission Line as a Distributed Circuit	559
10.3.1.	Transmission Line Equations from the Distributed Circuit Model	561
10.3.2.	Power and Energy – Poynting’s Theorem	562
10.4.	Scalar Wave Motion on Lossless Transmission Lines (Time Domain Analysis)	563
10.4.1.	Time-Domain Solution	563
10.4.2.	Forward and Backward Traveling Waves	566
10.5.	Sinusoidal Waves on Lossless Transmission Lines (Frequency Domain Analysis)	569
10.5.1.	Frequency-Domain Solution	570
10.5.2.	Forward and Backward Traveling Waves	571
10.5.2.1.	Wave Motion and Phase Velocity	571
10.5.2.2.	Energy and Power	573
10.5.2.3.	Input Impedance and Source Conditions	575
10.5.2.4.	Load and Source Boundary Conditions	576
10.5.3.	Complete Standing Waves	578
10.5.3.1.	A Short-Circuited Line	578
10.5.3.2.	Energy and Power	579
10.5.3.3.	Input Impedance and Source Conditions	581
10.5.3.4.	Other Standing-Wave Systems	582
10.6.	Complex Power (On Transmission Lines)	585
10.6.1.	Complex Power in Circuit Theory	585
10.6.2.	Complex Power in Transmission Line Theory	587
10.6.3.	The Complex Poynting Theorem (for Transmission Lines)	588
10.6.4.	Examples of Complex Power Flow	590
10.7.	General Impedance Termination	591
10.7.1.	Load Conditions and the Reflection Coefficient	592

10.7.2. Input Impedance and Source Conditions	594
10.7.3. Generalized Reflection Coefficient	595
10.7.4. Standing-Wave Measurements and the $\Gamma$ -Plane	596
10.7.5. The Smith Chart	600
10.7.5.1. Usefulness of the Smith Chart	601
10.8. Summary and Conclusions	604
Problems	605
 <b>Chapter Eleven: Plane Waves in Lossless Media</b>	
11.1. Uniform Plane Waves – Time-Domain Solution	612
11.1.1. Nature of Uniform Plane Wave (UPW) Solutions	612
11.1.2. $z$ -Directed Uniform Plane Waves (In Time Domain)	613
11.1.3. Fields and Power in Uniform Plane Waves	615
11.2. Fields and Power in the Frequency Domain	620
11.2.1. Use of Complex Vectors	620
11.2.2. Elliptical, Circular, and Linear Polarization	621
11.2.3. The Complex Poynting Theorem	625
11.3. Uniform Plane Waves in the Frequency Domain	628
11.3.1. $X$ -Polarized Waves	628
11.3.2. Nature of the Solutions	629
11.3.3. Role of Uniform Plane Waves	632
11.4. Normal Incidence of a Uniform Plane Wave	632
11.4.1. Normal Incidence on a Perfect Conductor	632
11.4.2. Normal Incidence on a Lossless Dielectric	636
11.4.3. Normal Incidence on Multiple Dielectrics	640
11.5. Oblique Incidence of a Uniform Plane Wave	642
11.5.1. Components of Uniform Plane-Wave Motion	643
11.5.2. Phase, Wavelength, and Wave Velocity	646
11.5.3. Geometry of Oblique Incidence	650
11.5.4. Oblique Incidence on a Perfect Conductor	651
11.5.4.1. Incident and Reflected Wave Solutions	651
11.5.4.2. Transmission Line Analogy	656
11.5.5. Oblique Incidence on an Interface Between Lossless Dielectrics	659
11.5.5.1. Polarization Parallel to the Boundary	659

11.5.5.2. Polarization in the Plane of Incidence	663
11.5.5.3. Brewster's (Polarizing) Angle	665
11.5.5.4. Critical Reflection	667
11.6. Nonuniform Plane Waves	672
11.6.1. Nature of the Solution	672
11.6.2. Phase Delay and Attenuation	674
11.6.3. TE and TM Plane Waves	675
11.6.4. Relationship Between Uniform and Nonuniform Plane Waves	678
11.7. Guided Waves—Lossless Rectangular Waveguides	679
11.7.1. Basic Equations	681
11.7.2. TE and TM Modes	682
11.7.3. $\text{TE}_{m,n}$ Modes	683
11.7.3.1. General Solution	683
11.7.3.2. Waveguide Boundary Conditions	685
11.7.3.3. $\text{TE}_{m,n}$ Waves	685
11.7.4. $\text{TM}_{m,n}$ Modes	687
11.7.5. Properties of Waves in Guides	688
11.7.6. Resonant Cavities	693
11.8. Summary and Conclusions	694
Problems	696
<b>Chapter Twelve: Radiation</b>	702
12.1. Definition of the Problem	702
12.2. Basic Field Laws and Potentials	703
12.2.1. Scalar and Vector Potentials	704
12.2.2. Wave Equations	705
12.2.3. General Wave Solutions—Use of Retarded Potentials	705
12.3. Elemental Dipole Radiation	708
12.3.1. Point-Source Fields	708
12.3.2. The Electric-Dipole (TM) Solution	710
12.3.3. Properties of the Dipole Field	713
12.3.3.1. Wave Motion	713
12.3.3.2. Wave Impedances	714
12.3.3.3. Complex Poynting Vector and Radiated Power	715
12.3.4. The Magnetic-Dipole (TE) Solution	717
12.4. Physical Antennas	722
12.4.1. Nature of the Problem	722
12.4.2. The Physical Electric Dipole	723
12.4.2.1. Details of the Solution	723

12.4.2.2. Impedance Characteristics	727
12.4.2.3. Radiation Characteristics	732
12.4.3. A Half-Wave Antenna	734
12.4.3.1. Details of the Solution	734
12.4.3.2. Radiation Characteristics	736
12.5. The Receiving Properties of a Dipole	739
12.6. Dipole Arrays	743
12.6.1. Element Factor and Array Factor	743
12.6.2. A Two-Dipole Array	746
12.6.3. An $N$ -Dipole Array	750
12.7. Summary and Conclusions	753
Problems	754
<b>Appendix 1: Differential Operators in Orthogonal Coordinates</b>	<b>758</b>
<b>Appendix 2: Summary of Mathematical Formulas</b>	<b>760</b>
<b>Appendix 3: Solutions of Laplace's Equation in Cartesian, Cylindrical, and Spherical Coordinates</b>	<b>762</b>
<b>Appendix 4: Uniform Plane Waves in Lossy Media</b>	<b>763</b>
<b>Index</b>	<b>775</b>

**Sections that may be omitted from a Minimum Undergraduate Subject**

5.7.4	A Rectangular Air Slot
6.1–6.4	Two-Dimensional Solutions of Laplace's Equation in Cylindrical Coordinates
6.7.2–6.9	A Spherical Coil, etc.
7.4.3	A Uniformly Polarized Sphere
7.5.1	A Sphere of Uniform Permittivity in a Uniform Field
7.7	The Amperian-Current Model
7.10.1.1	Case (1)—Amperian-Current Model
8.3.3	Some Difficulties in Identification
8.6.2–8.6.3	Effects of Outside Fields on Power Flow, etc.
8.7–8.8	Polarization Energy and Electric Energy, etc.
9.4–9.8	A Power Series Approach to Time-Varying Fields
10.2.4	Transmission Line Parameters
11.2.2	Elliptical, Circular, and Linear Polarization
11.5–11.6	Oblique Incidence of a Uniform Plane Wave, etc.
12.4.2	A Magnetic Dipole
12.5	A Physical Dipole Field
12.6.2	Wave Impedance
12.7	Radiation From Dipole Arrays
