Contents

Foreword by Victor F. Weisskopf	vii
Preface by the Editor	ix
Survey of the Historical Development and the Current	
Problems of Electrodynamics	1
1. Electrostatics and Magnetostatics	4
1. Coulomb's law	4
2. The field of point charges	7
3. Volume and surface charge distributions	14
4. Energy of the electrostatic field	18
5. Example: charge distributions with spherical symmetry	23
6. Proof of the equivalence of the electrostatic field equations	
with Coulomb's law	27
7. Dielectrics, phenomenological treatment	28
8. Electron theory interpretation of dielectric phenomena	33
9. The potential problem	40
10. Curvilinear coordinates	43
11. Examples of solutions of the potential problem	45
12. Magnetostatics	54
13. Units and dimensions	57
2. Steady-State Currents	59
14. Theory of steady-state currents	59
15. The magnetic fields of steady-state currents	65
16. The equivalence of the magnetic field due to closed current	
loops with that due to a distribution of magnetic dipoles	72

v

.

vi	CONTENTS
17. Ponderomotive forces	77
18. The principle of action and reaction for electric and	
magnetic forces. The Maxwell stress tensors	81
3. Quasi-Static Fields	88
19. Faraday's law of induction	88
20. The energy of current systems	90
21. Titne-dependent current flow in circuits	94
22. The skin effect	103
23. The law of induction for moving conductors	106
4. Rapidly Varying Fields	109
24. The Maxwell equations	109
25. Electromagnetic waves in vacuum	113
26. Conservation of energy and momentum	117
27. Electromagnetic waves in material media	124
28. Radiation of electromagnetic waves	125
29. The field of a point charge in uniform motion	143
30. Radiation damping	146
Bibliography	153
Appendix. Comments by the Editor	155
Index	157
