

CONTENTS

Preface	v
I. Conservation Laws of Classical Electrodynamics	
Introduction	1
1. Basic equations of classical electrodynamics	3
1.1 Defining equations	3
1.2 Consequences	4
2. Conservation laws for a continuous electromechanical system	9
2.1 Continuous electromechanical system	10
2.2 Four examples of mechanical energy and momenta	19
2.3 Lorentz power, force and its momenta in terms of balance equations	25
2.4 Energy conservation	33
2.5 Conservation of linear momentum	35
2.6 Conservation of angular momentum	36
2.7 Conservation of boost momentum	39
2.8 Centre-of-energy and centre-of-electromechanical system	41
2.9 Charges and currents initially moving with constant velocities	46
2.10 Conservation laws for finite volumes	49
2.11 Conservation laws for scattered flows	52
3. Electrodynamic steady states	54
3.1 Steady charges, currents and fields	54

3.2	Electrodynamic energy	56
3.3	Electrodynamic energy flow	59
3.4	Electrodynamic linear momentum	60
3.5	Electrodynamic angular momentum	61
3.6	Electrodynamic stress tensor	61
3.7	Adiabatic changes of steady electric charges and currents . .	62
4.	Lorentz-covariant formulations	67
4.1	Basic equations	67
4.2	Energy-momentum tensor	69
4.3	Relativistic angular momentum tensor	73
4.4	Hamilton's principle of stationary action	77
5.	Electromagnetic radiation	92
5.1	Distributions of radiated electromagnetic fields, and of their energy and momenta	92
5.2	Radiative power, pressure and torque	97
5.3	Harmonic oscillations of electric charges and currents —elliptically polarized plane waves	100
6.	Energy, and linear, angular and boost momenta radiated by a charged mechanical medium	104
6.1	Definitions and properties	105
6.2	Energy and momenta irretrievably supplied by an outside agency during a cyclic motion of a charged mechanical medium	111
6.3	Periodic phenomena	119
6.4	The total energy and momenta of radiated fields, and their flows towards infinity	121
6.5	Changes of steady charge and current densities	128
6.6	Dirac's subtraction scheme	130
6.7	Radiationless motions of electric charges and currents . . .	132

7. Comparison of the properties of Maxwell and electrodynamic densities of energy, linear and angular momenta, and their flows	135
7.1 The energy flow at static points	136
7.2 A slowly charging circular parallel-plate capacitor	137
7.3 Paradoxes of an infinitely long solenoid	138
7.4 Intrinsic angular momentum of electromagnetic fields	141
7.5 Radiative asymptote	143
7.6 Total energy and momenta, and their flows	145
7.7 Summary of the comparisons	146
8. Physical significance of the retarded Lorentz-gauge potentials	149
8.1 Potentials versus electric and magnetic fields	149
8.2 A simulated experimental inference of classical electrodynamics in terms of the retarded Lorentz-gauge potentials	154
8.3 Uniqueness of the retarded Lorentz-gauge potentials?	156
8.4 Gauge invariance?	158
II. Classical Pointlike Charged Particles	
Introduction	161
9. Pointlike charge	165
9.1 Concept of a pointlike charge	165
9.2 Energy, and linear, angular and boost momenta irreversibly lost by an accelerated pointlike charge	167
9.3 Examples of radiating pointlike charges	170
10. Motion of classical pointlike charged particles in external force fields	174
10.1 Equation of motion	176
10.2 Physical properties required of models of CPC-particles and their implications	185

10.3	Non-relativistic linearized models of CPC-particles	197
10.4	On different approaches to the derivation of an equation of motion for a CPC-particle	207
11.	Asymptotic behaviour of trajectories of classical pointlike charged particles in response to a small and slowly changing external force	213
11.1	Lorentz-covariant form of the equation of motion	214
11.2	Dirac's and Bhabha's conditions	215
11.3	Asymptotic differential relations for a small and slowly changing external force	220
11.4	Applications of asymptotic differential relations	228
11.5	Forced, damped, radiating, non-relativistic harmonic oscillator	234
	Epilogue	241
	A An evaluation	241
	B Axiomatization	249
	C Useful questions	250
	Appendices	261
	A Notation	261
	B Existence of intrinsic angular and boost momenta, and their flows	264
	C A derivation of the electrodynamic differential balance equations	265
	D Asymptotic behaviour of a steady vector potential	267
	E Total Lorentz force, its power and momenta in a quasi-steady approximation	268
	F Relativistic notation	269
	G Transformations of a four-vector and an antisymmetric four-tensor	272

Contents

xiii

H	Time-likeness of the total four-momentum	274
I	The radiative asymptote	274
J	Harmonic oscillations of electric charges and currents	278
K	Covariance of radiated energy and momenta	279
L	Total energy and momenta of radiated fields	281
M	Integral balance equations for temporary changes of steady electric charge and current densities	282
N	Dirac's subtraction scheme	285
O	Auxiliary formulae for a pointlike charge	286
P	Non-existence of a particular rational function	287
Q	Approximability of linear systems with memory by differential relations	288
R	Asymptotic approximations to the acceleration four-momentum	292
S	Derivation of an asymptotic approximation	293
T	Resonance and breadth of a modified resonant line shape	293
Bibliography and index of names		295
List of special symbols and abbreviations		311
Subject Index		317
