CONTENTS

Preface v

1 Basic Statistical Mechanics

1.1 Phase transitions and critical points 1
1.2 The scaling hypothesis 4
1.3 Universality 7
1.4 The partition function 8
1.5 Approximation methods 9
1.6 Exactly solved models 11
1.7 The general Ising model 14
1.8 Nearest-neighbour Ising model 21
1.9 The lattice gas 24
1.10 The van der Waals fluid and classical exponents . . . 30

2 The One-dimensional Ising Model

2.1 Free energy and magnetization 32
2.2 Correlations 35
2.3 Critical behaviour near $T = 0$ 37

3 The Mean Field Model

3.1 Thermodynamic properties 39
3.2 Phase transition 42
3.3 Zero-field properties and critical exponents 44

3.4 Critical equation of state 45
3.5 Mean field lattice gas 46

4 Ising Model on the Bethe Lattice

4.1 The Bethe lattice 47
4.2 Dimensionality 49
4.3 Recurrence relations for the central magnetization . . 49
4.4 The limit $n \to \infty$ 51
4.5 Magnetization as a function of H 53
4.6 Free energy 55
4.7 Low-temperature zero-field results 56
4.8 Critical behaviour 57
4.9 Anisotropic model 58

5 The Spherical Model

5.1 Formulation of the model 60
5.2 Free energy 61
5.3 Equation of state and internal energy 64
5.4 The function $g'(z)$ 65
5.5 Existence of a critical point for $d > 2$ 66
5.6 Zero-field properties: exponents $\alpha, \beta, \gamma, \gamma'$ 68
5.7 Critical equation of state 70

6 Duality and Star–Triangle Transformations of Planar Ising Models

6.1 General comments on two-dimensional models . . . 72
6.2 Duality relation for the square lattice Ising model . . 73
6.3 Honeycomb-triangular duality 78
6.4 Star-triangle relation 80
6.5 Triangular–triangular duality 86

7 Square-Lattice Ising Model

7.1 Historical introduction 88
7.2 The transfer matrices V, W 89
7.3 Two significant properties of V and W 91

7.4 Symmetry relations 95
7.5 Commutation relations for transfer matrices . . . 96
7.6 Functional relation for the eigenvalues 97
7.7 Eigenvalues Λ for $T = T_c$ 98
7.8 Eigenvalues Λ for $T < T_c$ 101
7.9 General expressions for the eigenvalues 108
7.10 Next-largest eigenvalues: interfacial tension, correlation length and magnetization for $T < T_c$ 111
7.11 Next-largest eigenvalue and correlation length for $T > T_c$. 119
7.12 Critical behaviour 120
7.13 Parametrized star–triangle relation 122
7.14 The dimer problem 124

8 Ice-Type Models

8.1 Introduction 127
8.2 The transfer matrix 130
8.3 Line-conservation 131
8.4 Eigenvalues for arbitrary n 138
8.5 Maximum Eigenvalue: location of $z_1, \ldots, z_n$ . . . 140
8.6 The case $\Delta > 1$ 143
8.7 Thermodynamic limit for $\Delta < 1$ 143
8.8 Free energy for $-1 < \Delta < 1$ 145
8.9 Free energy for $\Delta < -1$ 148
8.10 Classification of phases 150
8.11 Critical singularities 156
8.12 Ferroelectric model in a field 160
8.13 Three-colourings of the square lattice 165

9 Alternative Way of Solving the Ice-Type Models

9.1 Introduction 180
9.2 Commuting transfer matrices 180
9.3 Equations for the eigenvalues 181
9.4 Matrix function relation that defines the eigenvalues . . 182
9.5 Summary of the relevant matrix properties 184
9.6 Direct derivation of the matrix properties: commutation . 185
9.7 Parametrization in terms of entire functions . . . 190
9.8 The matrix $Q(v)$ 192
9.9 Values of ρ, λ, v 200

10 Square Lattice Eight-Vertex Model

10.1 Introduction 202
10.2 Symmetries 204
10.3 Formulation as an Ising model with two- and four-spin interactions 207
10.4 Star–triangle relation 210
10.5 The matrix $Q(v)$ 215
10.6 Equations for the eigenvalues of $V(v)$ 222
10.7 Maximum eigenvalue: location of $v_1, \ldots, v_n$ . . . 224
10.8 Calculation of the free energy 228
10.9 The Ising case 237
10.10 Other thermodynamic properties 239
10.11 Classification of phases 245
10.12 Critical singularities 248
10.13 An equivalent Ising model 255
10.14 The XYZ chain 258
10.15 Summary of definitions of Δ, Γ, k, λ, v, q, x, z, p, μ, w . 267
10.16 Special cases 269
10.17 An exactly solvable inhomogeneous eight-vertex model . 272

11 Kagomé Lattice Eight-Vertex Model

11.1 Definition of the model 276
11.2 Conversion to a square-lattice model 281
11.3 Correlation length and spontaneous polarization . . . 284
11.4 Free energy 285
11.5 Formulation as a triangular-honeycomb Ising model with two- and four-spin interactions 286
11.6 Phases 293
11.7 $K'' = 0$: The triangular and honeycomb Ising models . . 294
11.8 Explicit expansions of the Ising model results . . . 300
11.9 Thirty-two vertex model 309
11.10 Triangular three-spin model 314

12 Potts and Ashkin–Teller Models

12.1 Introduction and definition of the Potts model . . . 322
12.2 Potts model and the dichromatic polynomial . . . 323

12.3 Planar graphs: equivalent ice-type model 325
12.4 Square-lattice Potts model 332
12.5 Critical square-lattice Potts model 339
12.6 Triangular-lattice Potts model 345
12.7 Combined formulae for all three planar lattice Potts models 350
12.8 Critical exponents of the two-dimensional Potts model . 351
12.9 Square-lattice Ashkin–Teller model 353

13 Corner Transfer Matrices

13.1 Definitions 363
13.2 Expressions as products of operators 369
13.3 Star–triangle relation 370
13.4 The infinite lattice limit 376
13.5 Eigenvalues of the CTMs 377
13.6 Inversion properties: relation for $\kappa(u)$ 382
13.7 Eight-vertex model 385
13.8 Equations for the CTMs 389

14 Hard Hexagon and Related Models

14.1 Historical background and principal results 402
14.2 Hard square model with diagonal interactions . . . 409
14.3 Free energy 420
14.4 Sub-lattice densities and the order parameter R . . . 426
14.5 Explicit formulae for the various cases: the Rogers–Ramanujan identities 432
14.6 Alternative expressions for the κ, ρ, R 443
14.7 The hard hexagon model 449
14.8 Comments and speculations 452
14.9 Acknowledgements 454

15 Elliptic Functions

15.1 Definitions 455
15.2 Analyticity and periodicity 456
15.3 General theorems 458
15.4 Algebraic identities 460
15.5 Differential and integral identities 464

15.6 Landen transformation 466
15.7 Conjugate modulus 467
15.8 Poisson summation formula 468
15.9 Series expansions of the theta functions 469
15.10 Parametrization of symmetric biquadratic relations . . 471
