Chapter 1. Cluster Methods in Equilibrium Statistical Mechanics of Fluids
Hans C. Andersen

1. Introduction	1
2. Graph-Theoretic Definitions	2
2.1. Definition of a Graph and the Ideas of Topological Equivalence and Connectivity	2
2.2. Point Functions, Bond Functions, and the Definition of the Value of a Graph	6
3. Partition Function, Pair Correlation Function, and Their Graphical Representation	9
3.1. Statistical-Mechanical Definitions	9
3.2. Cluster Expansion Expressions for $\mathcal{A}$ and g	11
4. Topological Reduction	15
5. General Philosophy of the Renormalization Method	19
5.1. Motives for the Use of Renormalization	19
5.2. Strategies for Dealing with the Cluster Series for a Particular Fluid	20
6. Applications of Cluster Theory	21
6.1. Low-Density Virial Series for Nonpolar Fluids	21
6.2. Mayer Theory of Ionic Solutions	23
6.3. Blip Function Theory	25
6.4. Perturbation Theory of Fluids	29
6.5. γ -Ordering and Γ -Ordering	31
6.6. Optimized Cluster Theory	35
6.7. Hydrogen-Bonded Fluids	38

7. Concluding Remarks	43
References	44

Chapter 2. Fluids with Long-Range Forces: Toward a Simple Analytic Theory

G. Stell

1. Introduction	47
2. Some General Features of the Fluids under Consideration	49
3. Large λ -Small λ Interpolation; Padé Approximants	55
4. Large r -Small r Interpolation; The Mean Spherical Approximation	57
5. Beyond the MSA	57
5.1. Γ Ordering, Nodal Contraction, Nodal Ordering, Nodal Approximation	57
5.2. Mixed Perturbation Theory	70
6. Summary of Results	71
Appendix	77
References	82

Chapter 3. Electrolyte Solutions at Equilibrium

Harold L. Friedman and William D. T. Dale

1. Introduction	85
2. Models for Ionic Solutions	86
2.1. Hamiltonian Models	86
2.2. Choice of Level	86
2.3. Principal Features of Interionic Forces	88
2.4. Additional Contributions to Interionic Forces	89
2.5. Current Research on Interionic Forces in Solution	91
3. Measurable Properties of Solutions at Equilibrium	91
3.1. Solvation Coefficients	91
3.2. Thermodynamic Excess Functions. Solutions of a Single Electrolyte	92
3.3. Thermodynamic Excess Functions. Mixed Electrolytes	93
3.4. Thermodynamic Excess Functions. Mixtures of Electrolytes with Nonionic Solutes	94
3.5. Partial Structure Factors	95

4.	McMillan–Mayer Theory	95
4.1.	Basic Grand Ensemble Equations	95
4.2.	McMillan–Mayer Theory	96
4.3.	More General Results	99
4.4.	General Significance of the MM Theory	99
5.	Thermodynamic Aspects of the McMillan–Mayer Theory . . .	101
5.1.	Solvation Thermodynamics	101
5.2.	Thermodynamic Excess Functions. LR to MM Conversions	102
5.3.	Thermodynamic Excess Functions in the MM System . .	104
6.	Cluster Expansions	105
6.1.	Graph Theory	105
6.2.	Graphical Representation of the Grand Partition Function	107
6.3.	Ursell Functions of the W_N	108
6.4.	Cluster Functions	112
6.5.	Rooted Ursell Functions	113
6.6.	Cluster Expansion of A^{ex}	115
6.7.	Discussion of the Cluster Expansion of A^{ex}	116
6.8.	Mayer Resummation	118
7.	Integral Equations	123
7.1.	Ornstein–Zernike Equation	123
7.2.	Integral Equations for Nonionic and Ionic Systems . . .	124
7.3.	Mean Spherical Approximation	128
7.4.	Other Approximation Methods	129
7.5.	Quality Tests	129
	References	132

Chapter 4. A Guide to Monte Carlo for Statistical Mechanics: 1. Highways

J. P. Valleau and S. G. Whittington

1.	Introduction	137
2.	The Monte Carlo Method	139
2.1.	The Need for Refined Monte Carlo Sampling	139
2.2.	Importance Sampling	140
2.3.	The Metropolis Sampling Scheme	141
2.4.	Choice of the Transition Matrix	144
3.	Some Practical Details	146
3.1.	Typical Procedures	146
3.2.	Other Ensembles	148
3.3.	Nonfluid Problems	149

4. Boundary Conditions	150
4.1. Avoiding Surfaces: Periodic Boundary Conditions	150
4.2. Size and Shape of the Sample	151
4.3. Configurational Energy Estimation	153
5. Conclusion	161
Appendix A: Random Number Generators	161
Appendix B: Ewald Potential Technique	163
References	166

Chapter 5. A Guide to Monte Carlo for Statistical Mechanics: 2. Byways

J. P. Valleau and G. M. Torrie

1. Introduction	169
2. Estimations of Free Energy and Entropy	170
2.1. Salsburg and Others	171
2.2. Coldwell	171
2.3. Thermodynamic Integration	172
2.4. Communal Free-Energy Estimation	174
2.5. Widom's Particle Insertion Method	175
2.6. Grand Canonical Approach	175
2.7. McDonald and Singer: Energy Density Functions	177
2.8. Multistage Sampling	178
2.9. Umbrella Sampling Methods	178
3. Quantum Mechanical Calculations	182
3.1. Variational Calculations	182
3.2. Numerical Solution of Schrödinger's Equation	184
4. Microscopic Studies	185
4.1. Gas-Liquid Interface	185
4.2. Interionic Mean Forces	187
5. Conclusion	190
References	191

Chapter 6. Nucleation Theory

J. J. Burton

1. Introduction	195
2. Mathematical Formalism	198
2.1. The Nucleation Problem	199

2.2.	McDonald's Trick	201
2.3.	An Alternative Trick	204
2.4.	Some Remarks	207
3.	Homogeneous Gas Phase Nucleation	208
3.1.	Capture Rates	209
3.2.	Equilibrium Cluster Concentrations— Statistical-Mechanical Considerations	209
3.3.	The Drop Model	210
3.4.	Classical Nucleation Theory	211
3.5.	Criticisms of the Drop Model and Classical Nucleation Theory	215
3.6.	Statistical-Mechanical Emendations	216
3.7.	Modification of the Surface Free Energy	217
3.8.	A Microscopic Approach to the Cluster Free Energy	219
3.9.	A Proposed New Approach	221
4.	Condensation of Water on Ions	224
5.	Void Nucleation in Nuclear Reactor Materials	228
