

CONTENTS

Critical phenomena	1
B. Widom	
1. Kadanoff's scaling theory	1
2. Wilson's renormalization-group theory; introduction	4
3. A model Hamiltonian	11
4. The Wilson-Fisher ϵ -expansion	13
5. Other methods	18
6. Baker models	19
7. Critical points of higher order	29
8. Griffiths-Landau theory	34
9. Borderline dimensionality	41
References	43
Tricritical points in metamagnets and Helium mixtures	47
E.G.D. Cohen	
1. Introduction - experimental data	47
2. Spin 1/2 Ising model for the metamagnets	55
3. Hard sphere model for the Helium mixtures	63
4. Discussion	73
References	77
Renormalization theory for spin systems	81
J.M.J. van Leeuwen	
1. Renormalization transformation for a triangular lattice	81
2. Transformation of the free energy and the scaling fields	84
3. Amplitudes of the singularities	87
4. The spontaneous magnetization	91
5. Alternatives, failures and problems	94
References	100
Exactly solvable lattice models	103
P.W. Kasteleyn	
1. Spin models and vertex models	106
1.1. Spin models	106
1. Two-dimensional Ising models	106
2. One-dimensional generalized Heisenberg models	107
1.2. Vertex models	108

2. The transfer matrix in operator form	114
2.1. Introduction	114
2.2. The transfer matrix of the zero-field Ising model	114
2.3. The transfer matrix of the eight-vertex model	116
3. Relations between transfer matrices and spin Hamiltonians	118
3.1. Introduction	118
3.2. Transfer matrices and associated Hamiltonians	120
3.3. Commuting transfer matrices	125
4. Solution methods for spin and vertex models	128
4.1. The XY model and the Ising model	128
1. The XY model	128
2. The Ising model	131
4.2. The XXZ model and the six-vertex model	133
1. The XXZ model	133
2. The symmetric six-vertex model	138
4.3. The XYZ model and the symmetric eight-vertex model	140
1. The XYZ model	140
2. The symmetric eight-vertex model	145
5. Concluding remarks	153
References	153
*The functional integral approach to quantum statistical mechanics	157
J. Hijmans	
1. Introduction	157
2. A single particle in classical and quantum mechanics	158
3. Path-integral representation of the propagator for a single particle	163
4. Many-particle systems; the grand partition function of an ideal gas in an external field	167
5. Field dependence of the grand partition function	171
6. The grand partition function for a system of interacting particles	174
7. Field theoretical formulation	177
References	182
Almost equilibrium in an algebraic approach	185
M. Winnink	
1. The algebraic structure of quantum mechanics for finite systems	186
2. Kinematics of thermodynamic systems	195
3. Gibbs-states for finite systems	199
4. Perturbation of thermodynamic states	204
4.1. Kinematical perturbations	204

4.2. Dynamical perturbations	208
References	212
The statistical mechanics of classical analytic dynamics	215
J. Ford	
1. A model for ergodicity and mixing	217
2. A model having attractive forces	219
3. A model for irreversible and stochastic behavior	221
4. Coupled nonlinear oscillator systems	226
4.1. Introduction	226
4.2. Kolmogorov-Arnol'd-Moser theorem	226
4.3. Ergodicity for large perturbations	230
4.4. Ergodicity for nearly linear oscillator systems	234
5. The pathology of area-preserving mappings	237
5.1. Introduction	237
5.2. Pathological detail	240
6. Computer tests for statistical behavior	244
6.1. Introduction	244
6.2. Mathematical preliminaries	247
6.3. Henon-Heiles system	249
6.4. The Toda lattice	251
References	254
Stochastic differential equations	257
N.G. van Kampen	
1. First lecture: the problem	257
2. Second lecture: solution	261
3. Third lecture: applications	266
4. Fourth lecture: nonlinear equations	269
5. Appendix: line broadening	273
References	275
Kinetic and hydrodynamic theory of time correlation functions	277
J.R. Dorfman	
1. Introduction	277
2. The Boltzmann equation	279
3. The self diffusion coefficient	282
4. Viscosity and thermal conduction	289
5. The time correlation functions; general remarks	290

6. Kinetic theory and the time correlation functions; the short time behavior	293
7. The hierarchy equations	297
8. The long time behavior of $\rho_{\mu}^{(d)}(t)$	311
9. The hydrodynamic calculation of $\rho_{\mu}^{(d)}(t)$ for long times	319
10. Discussion	324
References	328
 Computer studies on fluid systems of hard-core particles	 331
W.W. Wood	
1. Introduction	331
2. Monte Carlo	331
2.1. Monte Carlo methods in general	331
1. Pseudo-random number generators	332
2. Non-uniform random number generators	334
3. Evaluation of definite integrals	334
2.2. Statistical mechanical preliminaries	336
1. Canonical ensemble relations	336
2. Finite periodic systems	337
2.3. Feasibility of using "Crude Monte Carlo" to calculate thermodynamic properties	339
2.4. The Metropolis, Rosenbluth, Teller method	341
1. Markov chains	342
2. Construction of a probability matrix	344
3. Molecular dynamics	348
3.1. Generalities	348
3.2. Approach to equilibrium	349
3.3. Equilibrium thermodynamic properties	352
3.4. Equilibrium time correlation functions	358
4. Some results from computer studies on various systems	363
4.1. The phase transition in hard disks and spheres	363
4.2. The long-time tails of the velocity autocorrelation function for hard disks and spheres	369
4.3. Lorentz models	370
1. The Ehrenfest wind-tree	370
2. The Lorentz gas with overlapping disks as scatterers	371
5. Some current work on hard disks and spheres	373
5.1. Velocity autocorrelation function; hydrodynamic theory for periodic systems	373
5.2. The (super) Burnett self-diffusion coefficient	378

1. Hard disks	378
2. Hard spheres	380
5.3. Asymptotic behavior of the van Hove self-correlation function	380
5.4. Non-equilibrium molecular dynamics; steady-state self-diffusion	384
6. Conclusion	386
References	387
Fluctuating hydrodynamics and renormalization of susceptibilities and transport coefficients	389
P. Mazur	
1. General introduction	389
1.1. Fluctuating hydrodynamics and renormalization of transport coefficients	389
1.2. Stochastic differential equations	390
2. On the critical behaviour of the dielectric constant for a non- polar fluid	392
2.1. Introduction	392
2.2. Formal theory	393
2.3. Expansion of the dielectric tensor in terms of density-density correlation functions	398
2.4. The extinction coefficient	400
2.5. The static, non-dispersive dielectric tensor	402
2.6. The real dispersive part of the dielectric tensor and the velocity of light	403
3. Renormalization of the diffusion coefficient in a fluctuating fluid	405
3.1. Derivation of a general formula for the renormalized diffusion coefficient	405
3.2. An expansion of the renormalized transport coefficient in correlation functions	407
3.3. The long time behaviour of the diffusion memory kernel, and the \vec{k}, ω dependent renormalized diffusion constant	409
3.4. Expansion of the renormalized diffusion coefficient in terms of the renormalized diffusion propagator	412
