1	Introduction	3
2	Three perspectives of the standard model	9
2.1	The microscopic driven lattice gas	10
2.2	Dynamic mean-field theories	16
2.3	A mesoscopic Langevin equation	19
3	Long range correlations above criticality	25
3.1	Generic singularities in two-point functions	26
3.1.1	Power law and exponential decays	26
3.1.2	A fixed line of Gaussian dynamic models	33
3.2	Three-point correlation functions	37
4	Critical phenomena	40
4.1	Simulation studies	40
4.1.1	Signals of a phase transition	41
4.1.2	Two-point correlations	41
4.1.3	Higher correlations	48
4.1.4	Finite-size effects in the standard model	51
4.2	Theoretical investigations	52
4.2.1	General scaling laws with strong anisotropy	53
4.2.2	Field theoretic renormalization group analysis	59
5	Physics below criticality	73
5.1	The co-existence curve	74

5.2	Dynamics of phase separation	76
5.3	Interfacial properties in steady states	80
5.3.1	Suppression of interfacial roughness	81
5.3.2	Shifted boundary conditions and “tilted” interfaces	83
5.3.3	Numerical and theoretical studies	90
6	Variations of the standard model	93
6.1	Random drive and multiple temperature models	94
6.1.1	Collective behaviour above T_c	95
6.1.2	Phase transitions and critical properties of the bulk	99
6.1.3	Anomalous correlations of interfacial fluctuations	103
6.1.4	Combinations of direct and random drives	105
6.2	Chemical potential gradients and drive defects	107
6.2.1	Systems with a chemical potential gradient only	108
6.2.2	Finger formation in combined drives	112
6.2.3	Effects of line defects in external fields	118
6.2.4	Stability of an interface in a transverse chemical potential gradient	119
6.3	The two-layer system	121
6.4	Multi-species models	127
6.4.1	The blocking transition	128
6.4.2	The polarized lattice gas	135
6.5	Repulsive interactions	138
6.6	Quenched random impurities	144
6.7	Special limits	148
6.7.1	Extreme anisotropic rate	148
6.7.2	Models in one dimension	154
7	Related non-equilibrium steady state systems	170
7.1	Models with competing conserved and non-conserved dynamics	171
7.2	Multi-temperature models with Glauber dynamics	173
7.3	Models for driven interfaces	175
7.4	Gel electrophoresis and polymers in sedimentation	179
7.5	Self-organized criticality and other models of generic scale invariance	183
7.6	Liquids in non-equilibrium steady states	187
7.6.1	Linearized hydrodynamics far from criticality	187
7.6.2	Phase transitions under shear	190
8	Summary and outlook	192
9	Acknowledgements	197
