

# CONTENTS

INTRODUCTION	vii
CHAPTER I. CLASSICAL MECHANICS OF PARTICLES	1
1.1. Constituents of matter. 1.2. Phase-space. 1.3. Interpretation of macro-physical quantities. 1.4. Virial theorems.	
CHAPTER II. CLASSICAL EQUILIBRIUM THEORY IN RETROSPECT	6
2.1. The canonical distribution. 2.2. Applications.	
CHAPTER III. IRREVERSIBILITY	10
3.1. Coarse-grained distributions. 3.2. Collision equation. 3.3. The Fokker-Planck equation.	
CHAPTER IV. VISCOSITY AND THERMAL CONDUCTIVITY OF GASES	21
4.1. Steady non-equilibrium distributions. 4.2. Method of calculation. 4.3. Determination of the transport coefficients. 4.4. The mean free path approximation.	
CHAPTER V. VISCOSITY AND THERMAL CONDUCTIVITY OF LIQUIDS	29
5.1. The liquid state. 5.2. Distributions in coordinates. 5.3. Transport coefficients.	
CHAPTER VI. STATISTICAL QUANTUM MECHANICS. GENERAL THEORY	38
6.1. Distribution functions. 6.2. Equilibrium, 6.3. Irreversibility.	
CHAPTER VII. STATISTICAL QUANTUM MECHANICS. APPLICATIONS	49
7.1. Gases. 7.2. The solid state. 7.3. Boltzmann's $H$ -theorem.	
CHAPTER VIII. DISSIPATIVE SYSTEMS	63
8.1. Brownian movement. 8.2. Stochastic processes. 8.3. Generalizations of thermodynamics.	
CHAPTER IX. PROBABILITY	74
9.1. Distributions and mean values, 9.2. Probability in physics.
