

CONTENTS

1. Classical Mechanics	1
1. Introduction, 1	
2. Newton's Law of Motion, 2	
3. Generalized Coordinates, 4	
4. Lagrange's Equations, 7	
5. Hamilton's Equations, 11	
6. Motion of a Rigid Body, 14	
7. Theory of Small Vibrations, 28	
8. The Virial Theorem, 35	
9. References, 37	
2. Quantum Mechanics	38
1. Historical Introduction, 38	
2. Formulation of Quantum Mechanics, 40	
3. The Matrix Formulation of Quantum Mechanics, 45	
4. Symmetric and Antisymmetric Wave Functions: the Pauli Principle, 53	
5. References and Footnotes, 56	
3. Thermodynamics	58
1. Introduction, 58	
2. The First Law of Thermodynamics, 59	
3. The Second Law of Thermodynamics, 61	
4. The Third Law of Thermodynamics, 68	
5. Thermodynamic Functions and Criteria of Equilibrium, 69	
6. A Method to Determine the Relations Between Thermodynamic Derivatives, 75	
7. Open Systems and the Chemical Potential, 77	

8. Chemical Equilibrium, 82
9. References, 84

4. Introduction to Statistical Mechanics

85

1. Introduction, 85
2. Statistical Compounding of Systems, 85
3. The Statistical Mechanical Basis of Thermodynamics, 95
4. The Explicit Expressions for Partition Functions, 106
5. Translational Partition Functions, 108
6. Classical Statistical Mechanics, 111
7. Application-Perfect Monatomic Gas; Gibbs' Paradox, 113
8. The Principle of Equipartition of Energy, 117
9. Rotational Partition Functions, 119
10. The Partition Function for a Harmonic Oscillator, 125
11. Equilibrium Constants, 127
12. Nature of Chemical Bonding, 131
13. The Principle of Detailed Balance of Equilibrium and the Ultimate Kinetic Unit, 137
14. Absolute Activities and Rates of Reaction, 141
15. Ultimate Reaction Kinetics, 145
16. Theory of Absolute Reaction Rates, 146
17. Saturation Statistics, the Langmuir Adsorption Isotherm, and Fermi-Dirac Statistics, 150
18. Condensation Statistics, Condensation of a Homogeneous Phase, and Bose-Einstein Statistics, 153
19. Dilute Statistics, Maxwell-Boltzmann or Classical Statistics, 155
20. Intermediate Statistics, Condensation in Fissures and Capillaries, 157
21. References and Footnotes, 162

5. Ensembles in Statistical Mechanics

165

1. Phase Space, 165
2. Liouville's Theorem, 167
3. The Ergodic Hypothesis and the Assumption of Equal *a priori* Probabilities for Equal Volumes in Phase Space, 171
4. The Density Matrix, 175
5. The Fundamental Postulates of Equal *a priori* Probabilities and Random *a priori* Phases for the Quantum Mechanical States of a System, 179
6. The Maxwell-Boltzmann Distribution, 181
7. Boltzmann's relation, 186
8. The Microcanonical Ensemble, 189
9. The Canonical Ensemble, 190

10. Thermodynamic Functions from the Canonical Ensemble, 194
11. Application-Perfect Monatomic Gas, 196
12. Energy Fluctuations in a Canonical Ensemble, 197
13. The Grand Canonical Ensemble, 200
14. Thermodynamic Properties from the Grand Canonical Ensemble, 203
15. Perfect Monatomic Gas and the Grand Canonical Ensemble, 206
16. Fluctuations in the Grand Canonical Ensemble, 207
17. Ensemble in Quantum Statistics, 209
18. Bose-Einstein and Fermi-Dirac Statistics, 210
19. Boltzmann's H-Theorem, 214
20. Discussion of Boltzmann's H-Theorem, 223
21. The Relation Between H and Entropy; Law of Increasing Entropy, 225
22. The H-Theorem for Ensembles, 226
23. The H-Theorem in Quantum Mechanics, 229
24. References, 231

6. Quantum and Classical Perfect Gases 234

1. Introduction, 234
2. Monatomic Perfect Gases, 235
3. Density of States, 237
4. Black-Body Radiation, 239
5. Perfect Bose-Einstein Gas: Einstein Condensation, 241
6. Perfect Fermi-Dirac Gas, 252
7. Diatomic Molecules, 258
8. Ortho- and ParaHydrogen, 260
9. Diatomic Gases at High Temperature, 263
10. Polyatomic Molecules, 263
11. Hindered Internal Rotation, 264
12. References and Footnotes, 268

7. The Dielectric, Diamagnetic and Paramagnetic Properties of Matter 270

1. Introduction, 270
2. Static Dielectric Constant, 276
3. Local Electric Field; the Lorentz Solution, 279
4. The Clausius-Mossotti Formula, 282
5. Orientational Polarization, 283
6. The Polarization Catastrophe, 287
7. Osager's Formula for a Polar Liquid, 289
8. Polar Solids, 302
9. Dipole Relaxation Time, 307

10. Model for the Debye Equations, 312
11. Density Fluctuations and Light Scattering, 314
12. Magnetic materials, 317
13. Thermodynamics and Statistical Mechanics of Magnetization, 320
14. Diamagnetism and the Larmor Precession, 321
15. Langevin Theory of Paramagnetism, 325
16. Origin of Permanent Magnetic Dipoles, 326
17. Quantum Theory of Paramagnetism, 327
18. Magnetic Cooling, 328
19. Nuclear Magnetic Resonance, 339
20. Spin-Lattice Relaxation Time, 343
21. Spin-Spin Interaction, 346
22. The Bloch Equations, 346
23. Steady State Solution of the Bloch Equations, 348
24. References, 355

8. Electrons in Solids

359

1. Classical Drude Theory, 359
2. Sommerfeld's Theory, 364
3. The Magnetic Susceptibility of Free Electrons, 365
4. The Richardson Effect, 368
5. The Boltzmann Transport Equation, 371
6. Electrical and Thermal Conductivity, 372
7. Thermoelectric Effects, 377
8. Isothermal Hall Effect, 383
9. Band Theory of Solids, 390
10. Intrinsic Semiconductors, 395
11. Impurity Semiconductors, 398
12. Conductivity and Isothermal Hall Effect in a Semiconductor, 407
13. Recombination and Lifetime of Minority Carriers, 410
14. p-n Junction, 413
15. References, 416

9. Cooperative Phenomena: Ferromagnetism and Antiferromagnetism: Critical Points

418

1. Introduction, 418
2. Ferromagnetism; Weiss' Theory, 424
3. Source of Weiss Field, 430
4. The Ising Model, 434
5. Lattice Gas and Other Models Equivalent to the Ising Model, 436
6. Symmetry, 442
7. The Mean Field Approximation, 444
8. Quasi-Chemical Approximation, 450

9. High-Temperature and Low-Temperature Expansions, 457
10. Kirkwood's High-Temperature Expansion, 464
11. The Transfer Matrix, 467
12. Exact Solution for a Two-Dimensional Square Lattice, 471
13. The Scaling Law Hypothesis, 476
14. Correlation Functions, 480
15. Kadanoff and Wilson Theories: Renormalization Group, 485
16. A Conjecture Concerning the Law of Rectilinear Diameters, 493
17. Antiferromagnetism, 495
18. Remarks, 499
19. References and Footnotes, 499

10. The Thermodynamic Properties of Crystals and of Black Body Radiation **503**

1. Introduction, 503
2. Einstein's Model, 504
3. Vibrations in Continuous Media: Density of States, 508
4. Radiation in a Box, 517
5. Debye's Model of Monotonic Crystals, 522
6. Intermolecular Forces, 529
7. Corresponding States, 536
8. Born-von Karman Theory of Crystal Lattices, 539
9. References, 546

11. Real Gases **548**

1. Introduction, 548
2. Imperfect Gases and the Virial Equation, 550
3. Imperfect Gas Pressure as a Power Series in the Activity, 554
4. Equation of State in Powers of the Density, 567
5. Virial Coefficients for Some Model Systems, 578
6. Argon Virial Coefficients, 582
7. References and Footnotes, 583

12. Theory of Liquids **585**

1. Introduction, 585
2. Direct Simulation Methods, 587
3. Thermodynamics of a Liquid in Terms of the Radial Distribution Function, 594
4. Direct Correlation Function, 603
5. The Percus-Yevick Theory for Hard Spheres, 607
6. The Mean Spherical Approximation, 614
7. The van der Waals Equation of State, 619
8. Perturbation Theory, 625
9. Simple Mixtures, 633

10.	The Debye-Hückel Theory for Dilute Strong Electrolytes, 640	
11.	Solution of the Mean Spherical Approximation for Charged Hard Spheres, 648	
12.	References, 654	
13.	Three Phase Partition Functions	657
1.	Introduction, 657	
2.	The Method of Significant Structures, 660	
3.	Application to Simple Classical Liquids, 665	
4.	The Thermodynamic Properties of Argon, 667	
5.	Degeneracy Near the Critical Point, 669	
6.	The Properties of Water, 676	
7.	Viscosity, 681	
8.	References, 683	
14.	Relaxation Times	686
1.	Chaos, 686	
2.	Times of Relaxation, 687	
3.	Chain Reactions, 688	
4.	Elementary Reactions, 691	
5.	Steady State Reaction Networks, 694	
6.	Absolute Rate Theory Reduces to Irreversible Thermodynamics and Yields the Onsager Reciprocity Relations Near the Equilibrium Limit, 699	
7.	Thermal Diffusion and the Soret Effect, 704	
8.	Significant Structures Theory of Viscosity and Diffusion, 706	
9.	The Stokes-Einstein Equation for Diffusion, 713	
10.	Viscosity in Dense Gases and Liquids, 716	
11.	Non-Newtonian Viscosity, 720	
12.	The Viscosity of High Polymers, 724	
13.	Potentials Across Membranes and at Interfaces, 729	
14.	Electrode Depolarization by Diffusion, 733	
15.	Sticking Coefficients at Surfaces, 736	
16.	The Quasi-Equilibrium Theory of Unimolecular Reactions, 741	
17.	Equilibrium and Reaction Rate Theory, 750	
18.	References and Footnotes, 751	
Appendix 1.	Some Physical Constants and Conversion Factors	758
Appendix 2.	Some Definite Integrals	760
Appendix 3.	Some Important Sums	763
Appendix 4.	Stirling's Approximation	765
