Introduction . . . . .	xi
------------------------	----

## PART I GENERAL THEORY

<b>CHAPTER I</b>	<b>Conservation Laws and Balance Equations . . . . .</b>	<b>1</b>
	1. General form of a balance equation . . . . .	1
	2. Conservation of mass . . . . .	4
	3. Conservation of momentum and equation of motion . . . . .	6
	4. Conservation of energy . . . . .	8
<b>CHAPTER II</b>	<b>The Second Law of Thermodynamics and the Entropy Balance Equation . . . . .</b>	<b>12</b>
	1. The second law of thermodynamics . . . . .	12
	2. Local equilibrium . . . . .	14
	3. Entropy balance equation . . . . .	16
	4. Basic thermodynamic relations . . . . .	19
	5. Second order differential of entropy . . . . .	23
	6. Use of complex variables . . . . .	27
<b>CHAPTER III</b>	<b>Linear Thermodynamics of Irreversible Pro- cesses . . . . .</b>	<b>30</b>
	1. Flows and forces . . . . .	30
	2. Onsager's reciprocity relations . . . . .	32
	3. Symmetry requirements on coupling of Ir- reversible processes . . . . .	33
	4. Non-equilibrium steady states and theorem of minimum entropy production . . . . .	34
	5. Chemical reactions . . . . .	38
	6. Concluding remarks . . . . .	41
<b>CHAPTER IV</b>	<b>Gibbs-Duhem Stability Theory of Thermo- dynamic Equilibrium . . . . .</b>	<b>44</b>
	1. Introduction . . . . .	44
	2. Gibbs-Duhem stability criterion . . . . .	44
	3. Explicit form of the stability conditions . . . . .	46

	4. Phase separation in binary mixtures . . . . .	47
	5. Stability of chemical reactions . . . . .	49
	6. Limitation of the Gibbs–Duhem theory . . . . .	51
<b>CHAPTER V</b>	<b>General Stability Theory of Thermodynamic Equilibrium . . . . .</b>	<b>53</b>
	1. Thermodynamic stability and entropy balance equation . . . . .	53
	2. Thermodynamic stability conditions . . . . .	55
	3. Comparison with kinetic stability theory . . . . .	58
<b>CHAPTER VI</b>	<b>Thermodynamic and Hydrodynamic Stability Conditions for Non-Equilibrium States . . . . .</b>	<b>61</b>
	1. Introduction . . . . .	61
	2. The definition of stability—Liapounoff functions . . . . .	62
	3. Stability of dissipative systems . . . . .	63
	4. Theorems of moderation and the Le Châtelier–Braun principle . . . . .	64
	5. Global stability conditions . . . . .	65
	6. Characteristic properties of $\delta^2s$ considered as a Liapounoff function . . . . .	66
	7. Stability involving convective effects . . . . .	67
	8. Comparison with kinetic stability theory . . . . .	70
	9. Separate thermodynamic and hydrodynamic stability conditions . . . . .	72
<b>CHAPTER VII</b>	<b>Explicit Form of the Stability Conditions for Non-equilibrium States . . . . .</b>	<b>73</b>
	1. Introduction . . . . .	73
	2. Thermal stability . . . . .	74
	3. Helmholtz’s theorem on the motion of viscous fluids . . . . .	78
	4. Chemical reactions . . . . .	80
	5. Excess balance equations . . . . .	82
	6. Excess entropy balance equation . . . . .	83
	7. Explicit stability criterion for dissipative processes . . . . .	86
	8. Stability and linear thermodynamics . . . . .	87
	9. Stability and entropy production . . . . .	88
	10. Stability and equilibrium . . . . .	89

	11. Comparison with the entropy balance equation . . . . .	90
	12. Hydro-thermodynamic stability . . . . .	93
	13. Explicit form of the separate thermodynamic and hydrodynamic stability criteria . . . . .	94
<b>CHAPTER VIII</b>	<b>Stability and Fluctuations . . . . .</b>	<b>96</b>
	1. Einstein's fluctuation formula . . . . .	96
	2. Chemical reactions . . . . .	97
	3. Fluctuations of temperature . . . . .	102
	4. Regression of fluctuations . . . . .	103
	5. Causal description and fluctuations . . . . .	104
<b>CHAPTER IX</b>	<b>The General Evolution Criterion . . . . .</b>	<b>106</b>
	1. Introduction . . . . .	106
	2. Evolution criterion for dissipative processes . . . . .	110
	3. Evolution criterion and theorem of minimum entropy production . . . . .	112
	4. Evolution criterion and steady-state conditions . . . . .	113
	5. Rotation around steady states—Kinetic potential . . . . .	116
	6. Behaviour of normal modes around a steady state in dissipative systems . . . . .	118
	7. Convective processes . . . . .	121
	8. Time-dependent convection processes . . . . .	124
<b>PART II: VARIATIONAL TECHNIQUES AND HYDRODYNAMIC APPLICATIONS</b>		
<b>CHAPTER X</b>	<b>The Local Potential . . . . .</b>	<b>126</b>
	1. Conservation equations and variational calculus . . . . .	126
	2. Local potential for the heat conduction problem . . . . .	127
	3. Time-dependent heat conduction problem . . . . .	133
	4. Relation with the Galerkin method . . . . .	134
	5. Convergence of the self-consistent method . . . . .	136
	6. The time-dependent problem . . . . .	141
	7. The iteration method . . . . .	141

	8. General formulation of the local potential for a steady state . . . . .	142
	9. General formulation of the local potential for the time-dependent processes . . . . .	146
	10. The excess local potential . . . . .	147
	11. Local potentials in kinetic theory . . . . .	149
	12. Comparison with other variational techniques . . . . .	152
<b>CHAPTER XI</b>	<b>Stability Problems in Fluids at Rest . . . . .</b>	<b>154</b>
	1. Introduction . . . . .	154
	2. Perturbation equations . . . . .	154
	3. Stability conditions for a fluid layer . . . . .	157
	4. Bénard instability and entropy production . . . . .	160
	5. Thermodynamic interpretation and dissipative structure . . . . .	163
	6. Neutral stability condition . . . . .	165
	7. The principle of exchange of stabilities and the evolution criterion . . . . .	166
	8. A variational free minimum principle for the critical Rayleigh number . . . . .	168
	9. Normal mode approach to the Bénard problem . . . . .	172
	10. Approximate determination of the critical Rayleigh number by the free minimum method . . . . .	175
	11. Onset of instability in the two-component Bénard problem . . . . .	178
	12. Stability of a vertical column of fluid . . . . .	182
<b>CHAPTER XII</b>	<b>Application of the Local Potential to Stability Problems of Laminar Flow . . . . .</b>	<b>186</b>
	1. Introduction . . . . .	186
	2. The eigenvalue problem for hydrodynamic stability . . . . .	188
	3. The excess local potential for hydrodynamic stability . . . . .	190
	4. The excess local potential for stability of flow with a transverse temperature gradient . . . . .	191
	5. The critical Reynolds number for the plane Poiseuille flow . . . . .	195

6. The critical Rayleigh number for the Bénard problem . . . . .	199
7. The Bénard problem for laminar flow . . . . .	200
8. Influence of a transverse temperature gradient on turbulence . . . . .	204

<b>CHAPTER XIII</b> Stability of Finite Amplitude Waves . . . . .	206
1. Introduction . . . . .	206
2. Sound waves . . . . .	206
3. Compression and rarefaction waves. Riemann invariants . . . . .	207
4. Small disturbances of travelling waves . . . . .	214
5. Instability of the simple compression wave . . . . .	216
6. Stability of the simple rarefaction wave . . . . .	217
7. Reduction of $P[Z]$ . . . . .	219

**PART III: CHEMICAL PROCESSES**

<b>CHAPTER XIV</b> Time Order in Chemical Reactions . . . . .	222
1. Introduction . . . . .	222
2. Thermodynamic threshold for chemical oscillations . . . . .	223
3. Sustained oscillations of the Lotka-Volterra type . . . . .	228
4. Chemical instabilities . . . . .	232
5. Time behaviour beyond the instability . . . . .	238
6. Limit cycle . . . . .	240
7. Comparison between the Lotka-Volterra model and limit cycle behaviour . . . . .	241
8. Fluctuations . . . . .	243
9. Example of oscillating systems—The Zhabotinski reaction . . . . .	244

<b>CHAPTER XV</b> Space Order and Dissipation in Chemical Reactions . . . . .	247
1. Introduction . . . . .	247
2. Symmetry breaking instabilities . . . . .	248
3. Thermodynamic interpretation of symmetry breaking instabilities . . . . .	252
4. Thermodynamic threshold for symmetry breaking instabilities . . . . .	254

5. Dissipative space structures . . . . .	255
6. Examples of a dissipative space structure The Zhabotinski reaction . . . . .	261
7. Limit cycles and dissipative structures in multi-enzymatic reactions . . . . .	263
<b>CHAPTER XVI Multiple Steady States . . . . .</b>	<b>272</b>
1. Introduction . . . . .	272
2. Single independent variable . . . . .	273
3. Model with multiple steady states . . . . .	274
4. Membrane excitability—the model . . . . .	278
5. Membrane excitability—steady-state equa- tions . . . . .	283
<b>CHAPTER XVII Unity of Physical Laws and Levels of Descrip- tion . . . . .</b>	<b>287</b>
1. Introduction . . . . .	287
2. Biological structures . . . . .	288
3. Hierarchy of structures . . . . .	290
<b>REFERENCES . . . . .</b>	<b>293</b>
<b>GLOSSARY OF PRINCIPAL SYMBOLS . . . . .</b>	<b>299</b>
<b>INDEX . . . . .</b>	<b>303</b>
