Foreword v

Preface vii

1 Mathematical Introduction 1

1-1 Basic definitions 1

1-2 The boundary condition 4

2 Information Contained in $G^>$ and $G^<$ 10

2-1 Dynamical information 10

2-2 Statistical mechanical information contained in G 13

3 The Hartree and Hartree-Fock Approximations 17

3-1 Equations of motion 17

3-2 Free particles 20

3-3 The Hartree approximation 21

3-4 The Hartree-Fock approximation 25

4 Effect of Collisions on G 28

4-1 Lifetime of single-particle states 28

4-2 Born approximation collisions 29

4-3 Structure of Σ_c and A 33

4-4 Interpretation of the Born collision approximation 36

4-5 Boltzmann equation interpretation 38

5 A Technique for Deriving Green's Function Approximations 41

5-1 Ordinary perturbation theory 44

5-2 Expansion of Σ in V and G_0 48

5-3 Expansion of Σ in V and G 50

6 Transport Phenomena 52

6-1 Boltzmann equation approach to transport 53

6-2 Green's function description of transport 60

6-3 Conservation laws for g(U) 64

6-4 Relation of g(U) to the distribution function f(**p**,**R**,T) 66

7 The Hartree Approximation, the Collisionless Boltzmann Equation, and the Random Phase Approximation 68

7-1 Collisionless Boltzmann equation 70

7-2 Linearization of the Hartree approximation --The random phase approximation 71

7-3 Coulomb interaction 74

7-4 Low-temperature fermion system and zero sound 79

7-5 Breakdown of the random phase approximation 83

8 Relation between Real and Imaginary Time Response Functions 87

8-1 Linear response 87

8-2 Continuation of imaginary time response to real times 94

8-3 Equations of motion in the real time domain 97

9 Slowly Varying Disturbances and the Boltzmann Equation 102

9-1 Derivation of the Boltzmann equation 103

9-2 Generalization of the Boltzmann equation 110

10 Quasi-Equilibrium Behavior: Sound Propagation 121

10-1 Complete equilibrium solutions 121

10-2 Local equilibrium solutions 125

10-3 Conservation laws 127

10-4 Application of conservation laws to the quasi-equilibrium situation 130

10-5 Sound propagation 136

11 The Landau Theory of the Normal Fermi Liquid 139

11-1 The Boltzmann equation 139

11-2 The conservation laws 143

11-3 Thermodynamic properties 148

12 The Shielded Potential 153

12-1 Green's function approximation for Coulomb gas 153

12-2 Calculation of the equation of state of a Coulomb gas 161

13 The T Approximation 177

13-1 Structure of the T matrix 177

13-2 Breakdown of the T approximation in metals 187

Appendix Finite-Temperature Perturbation Theory for G 191

References and Supplementary Reading 201
