# Contents

## *Notations and Conventions* 1

### *Chapter 1 Introduction*

1. What statistical mechanics is about 5
2. The problem of knowledge 6
3. Getting around the lack of initial data by  
separating a few degrees of freedom 7
4. Getting around the lack of initial data by guessing 8
5. The art and science of guessing 11

### *Chapter 2 Information*

1. Definition of information 14
2. An illustration 17
3. Missing information when a  
probability distribution is given 18
4. An infinite choice problem 20
5. A continuous choice problem 20

### *Chapter 3 Statistical Mechanics*

1. Introduction 23
2. Classical mechanics 23
3. Canonical transformations 26
4. Classical statistics 28
5. The missing information 31
6. Quantum mechanics 32
7. Quantum statistics 34
8. The missing information 37

## *Chapter 4 Choice of Probabilities*

1. The truth, the whole truth	39
2. Nothing but the truth	40
3. Maximum missing information—classical	42
4. Maximum missing information—quantum mechanical	45
5. Existence and uniqueness of the solution	47
6. The Legendre transform	50

## *Chapter 5 General Considerations*

1. The value of information and its age	52
2. The concept of “Simple quantities”	53
3. Past, future, and irreversibility	55
4. The role of constants of the motion. Thermal equilibrium	57

## *Chapter 6 Equilibrium*

1. Scope of our treatment	59
2. Choice of known constants of the motion	59
3. Equilibrium calculation	62
4. Mechanical and statistical Lagrange multipliers	63
5. Internal properties	65
6. The meaning of $\beta$	66
7. $\beta$ and temperature	68
8. The adiabatic theorem	71
9. Classical adiabatic theorem	72
10. Quantum mechanical adiabatic theorem	76
11. The most general equilibrium	78
12. Work and heat	81
13. Persistence of special equilibrium	84
14. Ideal heat machines	90

## *Chapter 7 Identical Particles*

1. Identical particles	98
2. A classical ideal gas of identical particles	96
3. The number of particles as a dynamical quantity	99
4. Grand canonical description of the classical ideal gas	103
5. The quantum mechanical ideal gas	104
6. Chemical equilibrium	107
7. Degenerate quantum ideal gases	111
8. Second quantization and the grand canonical approach	119
9. Problems	121

## *Chapter 8 Small Deviations from Equilibrium*

1. Introduction	122
2. Small deviations from equilibrium	122
3. Phenomenological equations	124
4. Onsager coefficients and Onsager relations	126
5. Diffusion	132
6. The diffusion coefficient	134
7. Connection with Einstein's treatment of diffusion	137
8. Dynamical disturbance of equilibrium	139
9. Electric conductivity	142
10. Alternating currents. The fluctuation-dissipation theorem	144
11. Quantum mechanical modifications	145

## *Chapter 9 Nonequilibrium Equations*

1. Introduction	149
2. Density in the phase space of $N$ particles	150
3. Density in the phase space of one particle	152
4. Equation of motion	153
5. The phenomenological time derivative	155
6. The Boltzmann equation	158
7. Phenomenological increase of entropy	159
8. The Maxwell-Boltzmann distribution of momenta	162
9. The quantum case	165
10. Projection operators as information	166
11. Time development of the occupation probabilities	168
12. The master equation	169
13. Properties of the master equation as a differential equation	171
14. The master equation for long times	173

*Appendix A: Constants and units* 177

*Appendix B: The classical analogue  
of second quantization* 178
