CONTENTS

Preface xvii
Introduction xix

CHAPTER ONE. Principles of Classical Statistical Physics 1

1.1. Statistical physics 1
1.2. Equations of motion for particles in macroscopic system 2
1.3. The Hamiltonian for a macroscopic system 3
1.4. Potential energy of the interaction between particles 3
1.5. The Hamiltonian for a system of oscillators 5
1.6. Functions of dynamical variables 6
1.7. Microscopic phase space density 7
1.8. Equation for the microscopic phase space density. Microscopic transport equations 8
1.9. An ensemble of identical macroscopic systems, the Gibbs ensemble 11
1.10. Liouville equation 13
1.11. Liouville theorem 15
1.12. Average values of functions of dynamical variables 16

CHAPTER TWO. Principles of Quantum Statistical Physics 19

2.1. The Schrödinger equation 19
2.2. Mean values 20
2.3. Addition and multiplication of operators 21
2.4. The Heisenberg representation 21

2.5. Various representations of the Schrödinger equation 22
2.6. The density matrix 24

CHAPTER THREE. Thermodynamical Theory of an Equilibrium State 27

3.1. Statistical and thermodynamic methods of describing thermal processes 27
3.2. Statistical equilibrium 28
3.3. Thermodynamic equilibrium 30
3.4. State functions and equations of state 30
3.5. Internal energy of the electromagnetic field 33
3.6. Quasistatic processes 34
3.7. Temperature 35
3.8. The First Law (first principle) of thermodynamics 36
3.9. Some applications of the First Law of thermodynamics 37
3.10. The Second Law of thermodynamics 38
3.11. Mathematical formulation of the Second Law of thermodynamics for quasistatic processes 39
3.12. Thermodynamic potentials 42
3.13. Systems with variable numbers of particles 44
3.14. Dependence of thermodynamic functions on the number of particles 45
3.15. The Second Law of thermodynamics for nonstatic processes 46
3.16. Mathematical formulation of the Second Law of thermodynamics for irreversible processes 48
3.17. Variation of the free energy during irreversible processes 49

CHAPTER FOUR. Statistical Theory of an Equilibrium State 51

4.1. Distribution function of the microstates of an isolated system, the Gibbs microcanonical distribution 51
4.2. Distribution function for the microstates of a system in a thermostat, the Gibbs canonical distribution 54
4.3. Statistical basis of the Second Law of thermodynamics for quasistatic processes 59
4.4. Entropy as a measure of uncertainty in a statistical description. Properties of functions $S[x]$ and $S[n]$ 61
4.5. Increase of entropy in the process of evolution. The Gibbs theorem 66

4.6. The Gibbs distribution for quantum systems 71
4.7. Relationship between the quantum and classical Gibbs distributions 73
4.8. The Gibbs distribution for a system with a variable number of particles 77
4.9. The Maxwell distribution 81
4.10. The Boltzmann distribution for a classical ideal gas 86
4.11. Thermodynamic functions for a classical ideal gas 89
4.12. Free energy and entropy of a classical ideal gas. The Gibbs paradox 91
4.13. The Nernst theorem, the Third Principle of thermodynamics 94

CHAPTER FIVE. Ideal Gas 99

5.1. Distribution of atoms in the space of quantum states 99
5.2. Bose and Fermi distributions 103
5.3. The Boltzmann distribution 107
5.4. Fermi and Bose distributions for a gas consisting of structureless particles 110

CHAPTER SIX. Fluctuations in the Thermodynamic Parameters 119

6.1. Distribution functions of the intrinsic parameters 119
6.2. Distribution functions of internal parameters in an equilibrium state 121
6.3. Conditional free energy. Conditional entropy. The Boltzmann principle 122
6.4. Fluctuations in the energy 127
6.5. Fluctuations in the thermodynamic forces 128
6.6. The mean and most probable values of the thermodynamic functions 130
6.7. Gaussian distribution for fluctuations in intrinsic parameters 131

CHAPTER SEVEN. Time and Phase Averages 139

7.1. Two ways of determining averages 139
7.2. Stochastization of motion in dynamic systems. Mixing. Krylov–Kolmogorov entropy. Entropy in time averages 143
7.3. Stationary and nonstationary random processes 146

7.4. Estimating the closeness of the time and phase averages 150
7.5. Averaging local functions of the dynamical variables over time 151
7.6. Physically infinitesimal intervals of time and length 155

CHAPTER EIGHT. Method of Distribution Functions and Method of Microscopic Phase Density 165

8.1. Sequence of distribution functions 165
8.2. The relationship between the gas-dynamic and thermodynamic functions and the one- and two-particle distribution functions 167
8.3. Equations for a sequence of equilibrium distribution functions 174
8.4. BBGKY equations for series of non-equilibrium distribution functions 176
8.5. Correlation functions 178
8.6. The microscopic phase space density method 181

CHAPTER NINE. Kinetic Theory of a Rarefied Gas 187

9.1. The binary collision approximation 187
9.2. The Boltzmann kinetic equation. The hard-sphere approximation 189
9.3. The Boltzmann collision integral 195
9.4. Derivation of the Boltzmann equation from the BBGKY equations relaxation 198
9.5. Properties of the Boltzmann collision integral 203
9.6. Law of entropy production. The Boltzmann H-theorem 206
9.7. Two extreme cases of the Boltzmann equation. Free molecular flow of a gas 207
9.8. Thermodynamic functions of a rarefied gas 212

CHAPTER TEN. Statistical Foundations of the Equations of Gas Dynamics 219

10.1. Gas-dynamic functions 219
10.2. Transport equations for the mass density, momentum density and kinetic energy density 220

10.3. Zeroth approximation in the gas-dynamic parameter. The local Maxwell distribution 222
10.4. The Grad method. The equations of gas dynamics in the first approximation in the gas-dynamic parameter 224
10.5. Balance equation for entropy density 234
10.6. Equations of gas dynamics for a non-ideal gas 237

CHAPTER ELEVEN. Brownian Motion. Kinetic and Hydrodynamic Fluctuations 243

11.1. The Langevin equation 243
11.2. The Fokker–Planck equation 248
11.3. Diffusion of Brownian particles. The Einstein–Smoluchowski equation 252
11.4. Brownian motion of a harmonic oscillator 254
11.5. Thermal oscillations in an electric circuit. The Nyquist formula 257
11.6. Separating out the slow processes in the Brownian motion of an oscillator 260
11.7. The spectral distribution of the mean energy of the oscillations. Spectrum of the energy fluctuations 263
11.8. Amplitude and phase fluctuations. Phase diffusion 264
11.9. Brownian motion of an oscillator under the influence of a resonant external force 266
11.10. Kinetic fluctuations in a gas (fluctuations in the one-particle distribution function) 269
11.11. Langevin source in the Boltzmann equation 275
11.12. Langevin sources in the equations of gas dynamics 281
11.13. Fluctuations in the gas-dynamic functions in an equilibrium state 286
11.14. Brownian motion. The statistical basis of the Langevin equation 295
11.15. Kinetic fluctuations in Brownian motion 299
11.16. "Tails" in the time correlations of the fluctuations in the gas-dynamic functions 302
11.17. Residual time correlations and the $1/\omega$ spectrum (natural flicker noise) in Brownian motion 309
11.18. Flicker noise in films and filaments 317
11.19. Brownian motion. The H-theorem 319

CHAPTER TWELVE. Brownian Motion in Self-oscillating Systems 323

12.1. Langevin and Fokker–Planck equations 323
12.2. Stationary states. The energy distribution of the oscillations 326
12.3. Fluctuations in the energy and amplitude. Phase diffusion 327
12.4. Spectral distribution of the mean energy of the self-oscillations 329
12.5. Response of a self-oscillating system to a resonant influence 337
12.6. Brownian motion of a self-oscillating system. The H-theorem 342
12.7. Free energy when the fluctuations in the distribution function are taken into account 345
12.8. Entropy evolution in selforganization processes. H-theorem and S-theorem. 347

CHAPTER THIRTEEN. Fundamentals of the Thermodynamics of Nonequilibrium (Irreversible) Processes 351

13.1. Thermodynamic description of reversible and irreversible processes 351
13.2. Transport equations. The local-equilibrium hypothesis 354
13.3. Equations of hydrodynamics 356
13.4. Balance equation for entropy. Entropy production 358
13.5. Thermodynamics of linear dissipative systems. The Onsager principle 362
13.6. Onsager relations 365
13.7. Balance equation for entropy in the thermodynamics of nonequilibrium processes 369
13.8. Langevin source in the Boltzmann kinetic equation for large deviations from equilibrium 371
13.9. Influence of hydrodynamic (averaged) motion on the intensities of the Langevin sources in the equations of hydrodynamics 375
13.10. Two methods of determining the kinetic coefficients in hydrodynamics 378

13.11. Natural and effective regularization of equations in hydrodynamics 380
13.12. Effective nonlinear dissipation in the equations of hydrodynamics 383
13.13. Non-equilibrium phase transitions. Dissipative structures 387

CHAPTER FOURTEEN. Statistical Description of Electromagnetic Processes 393

14.1. Maxwell equations. Constitute relations 393
14.2. Microscopic equations for the electromagnetic field (Lorentz equations). Balance equations for the momentum and energy density of the field 397
14.3. Thermal (equilibrium) fluctuations in the electromagnetic field 400
14.4. Rayleigh–Jeans and Planck formulas 403

CHAPTER FIFTEEN. Fully Ionized Plasma 409

15.1. Microscopic equations for the charged particles and the field 409
15.2. Basic parameters of a Coulomb plasma 412
15.3. Transport equations for the microscopic functions 417
15.4. Averaging the microscopic equations. The polarization approximation 419
15.5. Spectral densities of the small-scale fluctuations in a source 423
15.6. Spectral densities of the fluctuations in a Coulomb plasma 426
15.7. Spectral densities of the fluctuations for a plasma in equilibrium. Thermodynamic functions of a plasma 429
15.8. Collision integrals for a Coulomb plasma. The Balescu-Lennard collision integral 433
15.9. Effective potential. The Landau collision integral 435
15.10. Properties of the Balescu–Lennard and Landau collision integrals 439
15.11. Electromagnetic field fluctuations in a relativistic plasma 440
15.12. Kinetic equations for a relativistic plasma 446
15.13. Relaxation times (collision frequencies) 447
15.14. Wave properties of a plasma 448

15.15. *Collisionless plasma* approximation. The Vlasov equations 452
15.16. Waves in a *collisionless plasma*. Landau damping 454
15.17. Equations of gas-dynamics for a plasma 462
15.18. Temperature relaxation in a plasma 467
15.19. Electric conductivity of a plasma 468
15.20. Kinetic theory of fluctuations in a plasma 470
15.21. Influence of small-scale plasmons on kinetic processes. Anomalous resistance 475
15.22. Influence of large-scale plasmons on kinetic processes 478
15.23. Model collision integrals. The Bhatnagar–Gross–Kruck (BGK) collision integral 483
15.24. Foundations of the kinetic theory of a non-ideal plasma 486

CHAPTER SIXTEEN. System Containing Atoms and a Field. Classical Theory 489

16.1. Microscopic equations for a system containing atoms and a field 489
16.2. Averaging the microscopic equations. Equations for the fluctuations in the polarization approximation 492
16.3. Relaxation over the internal degrees of freedom due to radiation damping 497
16.4. Pressure exerted on atoms by electromagnetic radiation. Focusing of atomic beams and light beams 503
16.5. Large-scale (kinetic) fluctuations in the polarization and the field 507
16.6. Heating and cooling of atoms by an electromagnetic field 510
16.7. Kinetic equation for the distribution of the coordinates and the momenta of the atoms 512
16.8. Scattering of electromagnetic radiation by atoms 515
16.9. Spectra of the intensity of the scattered radiation 520
16.10. Equation for the polarization vector which takes the correlations in the positions of the atoms into account 522
16.11. Influence of the correlations in the positions of the atoms on the radiation damping coefficient and the frequency shift 526
16.12. Index of refraction extraction coefficient 530

CHAPTER SEVENTEEN. Quantum Kinetic Theory of Gases and Plasmas 533

17.1. The density matrix. Quantum distribution function 533
17.2. Two forms of the quantum Boltzmann collision integral 538
17.3. The quantum Boltzmann kinetic equation for a non-ideal gas 542
17.4. The phase-space-density operator 544
17.5. The method of moments. The polarization approximation 546
17.6. Fluctuation spectra. The collision integral 550

CHAPTER EIGHTEEN. Kinetic Theory of Chemically Reacting Systems. Partially Ionized Plasmas 553

18.1. Partially ionized Coulomb plasmas. Free and bound states of charged particles 553
18.2. System consisting of atoms and a field. Operator equations 558
18.3. Kinetic equations for a partially-ionized Coulomb plasma 560
18.4. The equilibrium state. Ionization equilibrium 562
18.5. Collision integrals for a partially ionized plasma 564
18.6. Equation for the densities of electrons, ions, and atoms 569
18.7. Kinetic fluctuations. Langevin sources in the equations for the concentrations of electrons, ions, and atoms 571

CHAPTER NINETEEN. System Containing Atoms and a Field-Quantum Theory 575

19.1. The kinetic equation for atoms 575
19.2. Induced and spontaneous emission. The Einstein coefficients 579
19.3. Polarizability of a system of atoms 582
19.4. Broadening of atomic emission lines 585
19.5. Shift in the transition frequencies under the influence of field fluctuations 586
19.6. Influence of a coherent field on dissipative processes 587
19.7. Cooling of atoms by a resonance field 590

CHAPTER TWENTY. Dense Gases and Liquids 591

20.1. Kinetic equations for dense gases 591
20.2. Equilibrium state. The superposition approximation 595
20.3. The direct correlation function. The hypernetted-chain approximation. The Percus–Yevick equation. The effective potential 598
20.4. First- and second-order phase transitions 601
20.5. The gas–liquid transition 603
20.6. Van der Waals' theory 604
20.7. The critical region 606
20.8. Fluctuations within the critical region. The van der Waals model 608
20.9. Spatial correlations. The Ornstein–Zernike formula 612

CHAPTER TWENTY-ONE. Second-Order Phase Transitions 615

21.1. Brownian motion in phase transitions 615
21.2. The Landau theory 619
21.3. Fluctuations in the order parameter. The Gaussian approximation 621
21.4. The mean-field approximation and the second-correlation approximation 623
21.5. Spectral distribution of the average energy. Coherent fluctuations 627
21.6. The Ginzburg–Landau equation. Spatial correlations 629
21.7. Critical exponents. The scale-invariance hypothesis 632
21.8. Setting up a correspondence between the two limits $T \to T_c$ and $N \to \infty$, $V \to \infty$ 634

CHAPTER TWENTY-TWO. Nonequilibrium Phase Transitions in Quantum Systems 641

22.1. Quantum generators 641
22.2. Self-oscillation without taking fluctuations into account 643
22.3. Sources for the fluctuations in the polarization of a quantum generator 644
22.4. Field equations which take the fluctuations into account 647

22.5. Emission spectrum of a quantum generator. Fluctuations in the amplitude and phase 650
22.6. Influence of critical fluctuations on the self-oscillation process 652
22.7. On some problems in the theory of nonequilibrium phase transitions 654

CHAPTER TWENTY-THREE. Turbulence 657

23.1. Turbulent motion 657
23.2. Initial equations. The Reynolds stresses 662
23.3. The onset of turbulence 666
23.4. Developed turbulence 670
23.5. Turbulent viscosity 674
23.6. Average turbulent flow 678
23.7. Transitions from laminar to turbulent flow – an example of a non-equilibrium phase transition 684
23.8. Entropy production and the entropy of laminar and turbulent flows 686

CHAPTER TWENTY-FOUR. The Fluctuation-Dissipation Theorem. Kinetic Equations for Multi-Particle Distribution Functions 691

24.1. The fluctuation-dissipation theorem (FDT) 691
24.2. The kinetic and thermodynamic forms of the FDT 696
24.3. The quantum kinetic equation for a multi-particle distribution function 706
24.4. The Leontovich equation. Boltzmann's model 713
24.5. A measure of the incompleteness of the statistical description 715
24.6. The fluctuation representation of the Boltzmann collision integral 717
24.7. Simultaneously taking strong and weak interactions into account 719

Conclusion 721
References 723
Subject Index 729
