## NOTATION

ix

I. THEORETICAL BASIS	1
1. The mass action law	1
2. Thermodynamic functions	3
A. The equilibrium constant and thermodynamic functions	3
B. Heat content and heat of formation	4
C. Temperature dependence of the heat of reaction	8
D. Entropy	13
E. Gibbs energy	17
3. Solutions	27
A. Partial molar Gibbs energy	27
B. Vapour pressures and partial Gibbs energies	30
C. The calculation of integral values from partial molar thermochemical data	34
D. Dilute solutions	45
1. Raoult's law	45
2. Henry's law	46
E. Atomistics and solution thermodynamics	48
F. Regular solutions	50
1. Calculation of activities using equilibrium diagrams	50
2. Spinodal decomposition	52
3. Order-disorder transformation	53
G. Non-regular solutions	54
H. Ternary solutions	57
II. EXPERIMENTAL METHODS	65
1. Calorimetric methods	66
A. Measurement of temperature	67
1. Mercury-in-glass thermometers	67
2. Platinum resistance thermometers	68
3. Thermocouples	69
4. Thermistors	69
5. Optical pyrometers	70
B. Determination of water equivalent	70
C. Isoperibol calorimetry	71
1. Principle of operation and evaluation of results	71
2. The bomb calorimeter	74

3. Heats of solution	80
4. Heat contents	88
5. Other methods	92
6. Isoperibol high-temperature calorimetry	98
D. Isothermal calorimetry	101
1. The ice calorimeter	101
2. The diphenyl ether calorimeter	102
E. Adiabatic calorimetry	103
1. Heat capacities	103
2. Heats of reaction	105
F. Other calorimeters	108
1. High-speed methods	108
2. Cooling method	109
3. Tian-Calvet calorimeters	109
G. Heats of fusion and of transformation	111
H. Comparison of methods	113
2. Equilibria with a gaseous phase	114
A. Static methods for the measurement of vapour pressure	116
1. Static methods using radiation	117
B. Gas-condensed phase equilibria in a closed system	119
C. Dynamic vapour-pressure methods	125
1. The transportation method	127
D. Other heterogeneous equilibria	131
1. H <sub>2</sub> -CH <sub>4</sub>	131
2. H <sub>2</sub> -NH <sub>3</sub>	132
3. H <sub>2</sub> -H <sub>2</sub> O	132
4. H <sub>2</sub> -H <sub>2</sub> S	137
5. H <sub>2</sub> -HCl	137
6. Other equilibria	138
E. Methods based on rates of evaporation: effusion methods	139
1. The Knudsen cell-mass spectrometer combination	143
2. Vapour transpiration	153
3. Torsion effusion	155
3. Electromotive forces	157
A. General	157
B. Solid electrolytes	159
1. Solid electrodes in oxygen concentration cells	160
2. Gas electrodes in oxygen concentration cells	165
3. Liquid electrodes	167
C. Other cells	168
III. THE ESTIMATION OF THERMOCHEMICAL DATA	179
1. Heat capacities	179
1. Monatomic gases	179
2. Diatomic gases	180
3. Polyatomic gases	181

4. Solids	181
5. Liquids	184
6. Some average values	185
2. Heats and entropies of transformation, fusion and evaporation	185
1. Evaporation	185
2. Fusion	186
3. Entropy and entropy changes	188
1. Solids	188
2. Gases	191
4. Heats of formation	192
1. General	193
2. Homologous series	195
3. Electronegativities	198
4. Volume change and heat of formation	199
5. Heats of solution	200
6. The packing effect	202
7. Temperature increase during compound formation	206
8. Examples of application	207
 <b>IV. EXAMPLES OF THERMOCHEMICAL TREATMENT OF METALLURGICAL PROBLEMS</b>	 210
1. Chill factors	211
2. Aluminothermic type reactions	212
A. The production of uranium by reduction of its fluoride with calcium and magnesium	212
B. The production of manganese and chromium by the aluminothermic process	213
3. The chlorination of metal oxides	214
4. The free evaporation of an oxide ceramic <i>in vacuo</i>	215
5. The reduction of magnesium oxide with silicon	217
6. Vapour phase transport of silicon carbide	218
7(a). Assessment of standard values	221
Silicon monoxide	221–226
7(b). Assessment of thermochemical values for a system exhibiting wide solution ranges	226
8. Calculation of metallurgical equilibrium diagrams	232
9. Ternary diagrams	235
10. Deoxidation of iron	236
A. Deoxidation with silicon	237
B. Deoxidation with aluminium	238
11. Refining of iron	239
12. Refining of lead	242
A. The removal of zinc from lead	244
13. The decarburisation of iron–chromium–carbon and iron–silicon–carbon liquid alloys	244
14. Metal–refractory interaction	247

viii *Contents*

15. The oxidation of alloys of platinum and of gold	252
16. The oxidation of iron-chromium alloys	254
V. THERMOCHEMICAL DATA. THE TABULATION OF DATA	
1. Heats of formation, entropies and heats of fusion	258
2. Vapour pressures	259
3. Heat capacities	260
4. General	260
5. Gibbs energy calculations	262
6. Data for metallic solutions	264
TABLES	
A. Heats of formation, standard entropies and structures	268
Aa. Structures	324
B. Heats and temperatures of transformation	326
C1. Heat capacities of the elements	336
C2. Heat capacities of the compounds	340
D. Vapour pressures and evaporation constants	358
E. Standard Gibbs energies of reaction	378
F. Thermochemical data of binary metallic systems	386
