	Preface	v
<b>I</b>	<b>THERMODYNAMICS</b>	<b>1</b>
CHAP. 1	<b>Introduction</b>	<b>3</b>
	Historical. Thermodynamics and Statistical Mechanics. Equilibrium States.	
CHAP. 2	<b>Heat, Temperature, and Pressure</b>	<b>9</b>
	Temperature. Heat and Energy. Pressure and Atomic Motion. Pressure in a Perfect Gas	
CHAP. 3	<b>State Variables and Equations of State</b>	<b>18</b>
	Intensive and Extensive Variables. Pairs of Mechanical Variables. The Equation of State of a Gas. Other Equations of State. Partial Derivatives	

CHAP. 4	<b>The First Law of Thermodynamics</b>	34
	Implications of the First Law. Work and Internal Energy. Heat and Internal Energy. Quasistatic Processes. Heat Capacities. Isothermal and Adiabatic Processes	
CHAP. 5	<b>The Second Law of Thermodynamics</b>	46
	Implications of the Second Law. Heat Engines. Carnot Cycles. Alternative Phrasings of the Second Law. The Thermodynamic Temperature Scale	
CHAP. 6	<b>Entropy</b>	59
	A Thermal-State Variable. Reversible Processes. Irreversible Processes. The Internal Energy, Euler's Equation. Entropy and Internal Energy. Entropy as Function of $T$ and $X$ . Entropy of a Monatomic Gas. Entropy of Mixing. The Third Law of Thermodynamics	
CHAP. 7	<b>Simple Thermodynamic Systems</b>	76
	The Joule Experiment. The Joule-Thomson Experiment. Black-Body Radiation. Paramagnetic Gas. Properties of Helium II. The Two-Fluid Model for Helium II. Wave Propagation of Pressure and of Temperature	
CHAP. 8	<b>The Thermodynamic Potentials</b>	93
	The Internal Energy. Enthalpy. The Helmholtz and Gibbs Functions. Procedures for Calculation. Examples and Useful Formulas. Entropy and Spontaneous Flow. Nonequilibrium Thermodynamics. Thermo-osmosis. Thermoelectric Effects	

CHAP. 9	<b>Changes of Phase</b>	119
	The Solid State. Melting. Clausius–Clapeyron Equation. Evaporation. Triple Point and Critical Point. Phase Changes of the Second Kind. Superconductivity	
CHAP. 10	<b>Chemical Reactions</b>	136
	Chemical Equations. Heat Evolved by the Reaction. Mixtures of Gases. Reactions in Gases. Electrochemical Processes	
II	<b>KINETIC THEORY</b>	147
CHAP. 11	<b>Probability and Distribution Functions</b>	149
	Probability. Distribution Functions. Binomial and Multinomial Distributions. Random Walk. The Exponential Distribution. The Poisson Distribution. The Normal Distribution	
CHAP. 12	<b>Velocity Distributions</b>	162
	Momentum Distribution for a Gas. The Maxwell Distribution. Mean Values. Experimental Verification. Collisions between Gas Molecules	
CHAP. 13	<b>Distributions in Phase Space</b>	175
	Phase Space. Trajectories and Densities in Phase Space. The Boltzmann Equation. The Maxwell–Boltzmann Distribution. A Simple Example. A More General Distribution Function. Mean Energy per Degree of Freedom. A Simple Crystal Model. Magnetization and Curie’s Law. Quantum Theory of Paramagnetism.	

CHAP. 20	<b>Statistical Mechanics of a Crystal</b>	282
	Normal Modes of Crystal Vibration. Quantum States for the Normal Modes. Summing over the Normal Modes. The Debye Formulas. Comparison with Experiment. An Ensemble Appropriate for Paramagnetism. The Coupling between Magnets and Lattice. Magnetic Entropy at Very Low Temperatures	
CHAP. 21	<b>Statistical Mechanics of a Gas</b>	302
	Factoring the Partition Function. The Translational Factor. The Indistinguishability of Molecules. Counting the System States. The Classical Correction Factor. The Effects of Molecular Interaction. The van der Waals Equation of State	
CHAP. 22	<b>A Gas of Diatomic Molecules</b>	317
	A Rotational Factor. The Gas at Moderate Temperatures. The Vibrational Factor	
CHAP. 23	<b>The Grand Canonical Ensemble</b>	325
	An Ensemble with Variable $N$ . The Grand Partition Function. The Perfect Gas Once More. Density Fluctuations in a Gas	
CHAP. 24	<b>Quantum Statistics</b>	332
	Occupational Numbers. Maxwell-Boltzmann Particles. Bosons and Fermions. Comparison among the Three Statistics. Distribution Functions and Fluctuations	
CHAP. 25	<b>Bose-Einstein Statistics</b>	346
	General Properties of a Boson Gas. Classical Statistics of Black-Body Radiation. The Planck Distribution Formula. Statistical Properties of a Photon Gas. Statistical Mechanics of a Boson Gas. Thermal Properties of a Boson Gas. The Degenerate Boson Gas	

<b>CHAP. 26</b>	<b>Fermi-Dirac Statistics</b>	<b>360</b>
	General Properties of a Fermion Gas. Intermediate Temperatures. The Completely Degenerate Fermion Gas. Low Temperatures. Electrons in Metals. Conduction Electrons in Good Conductors. Electrons as a Fermion Gas	
<b>CHAP. 27</b>	<b>Interparticle Forces</b>	<b>377</b>
	Particles and Wave Functions. Symmetric Wave Functions. Antisymmetric Wave Functions. Bound States and Free States. The Effect of Particle Spin. Larger Numbers of Particles. Deuterium and Helium Nuclei. Liquid Helium II, Metastable Equilibrium. Homonuclear Diatomic Molecules. Para- and Orthohydrogen. Ortho- and Paradeuterium.	
	Problems	404
	References	445
	Constants	446
	Glossary	448
	Index	450
