3.4. The mass renormalization 522
3.5. The wave function renormalization 526
3.6. The complete renormalization scheme 526

4. The bounds and the results 527
4.1. Estimates on strongly connected sets 527
4.2. Estimates on graphs 533
4.3. Statement of the results 536

Note added in proof 537

PART II

Course 6. Quasi-integrable mechanical systems, by G. Gallavotti *539*

1. Basic definitions on integrability and canonical integrability. Examples 542
2. Canonical integrability and the Arnold–Liouville theorem 556
3. Classical perturbation theory 564
4. Birkhoff theorems on harmonic oscillators 572
5. Some applications of perturbation theory. The precession of Mercury. Poincaré's triviality theorems 576
6. Phase space diffusion: Bounds on the time scales of Arnold's diffusion. Nekhorossev theorem 583
7. Resonances and chaos 591
8. Existence of nonresonant invariant tori and quasi-periodic motions. The Kolmogorov–Arnold–Moser theorem 604
9. Concluding remarks 621

References 623

Course 7. Stochastic differential equations—Large deviations, by S.R.S. Varadhan *625*

0. Introduction 628
1. Discrete-time martingales 628
2. Continuous-time martingales 633
3. Itô processes 635
4. Stochastic integrals 637

5. Itô's formula 641
6. Stochastic differential equations 644
7. Cameron–Martin–Girsanov formula 646
8. Partial differential equations and diffusion 648
9. Large deviations 649
10. Exit problems 651
11. The sausage problem 657
12. The polaron problem 673
13. Large deviations for empirical processes 676
References 678

Course 8. Introduction to disordered systems, by D.J. Thouless *681*

1. Introduction 684
2. Electron densities of states 684
2.1. Green functions and resolvents 685
2.2. Coherent potential approximation and related methods 686
2.3. Band tails and instantons 689
2.4. One-dimensional white noise problem 692
2.5. Exact results for the density of states 693
3. Electron localization 694
3.1. The Anderson model 695
3.2. Weak localization in one dimension 697
3.3. Scaling theory of localization 698
3.4. The nonlinear sigma model 702
3.5. Self-consistent theories 703
4. Interactions of electrons 705
4.1. Variable range hopping 706
4.2. Inelastic scattering 707
4.3. The Coulomb gap 708
4.4. Coulomb interactions between diffusing electrons 708
4.5. Magnetoresistance and the quantum Hall effect 709
5. Disordered magnetic systems 712
5.1. Dilute magnetic systems 712
5.2. Percolation 714
5.3. Spin glass 715
5.4. Random fields 718
References 719

Course 9. Mathematical aspects of the physics of disordered systems, by J. Fröhlich; lecture 5 in collaboration with A. Bovier and U. Glaus 725

1. General introduction to the problems 728
   1.1. Some general comments 728
   1.2. Topics in disordered systems theory 729
   1.3. Assorted remarks, acknowledgements 750

2. The "high-temperature" behaviour of disordered magnets 752
   2.1. Definition of models and main results 752
   2.2. Griffiths' theorem on Griffiths singularities 758
   2.3. A convergent resummation of the "high-temperature" expansion 766
   2.4. Ruelle–Araki and Mermin–Wagner-type theorems for one- and two-dimensional spin glasses 771
   2.5. Critical phenomena in disordered magnets 776

3. Ordering in disordered magnets at low temperatures 778
   3.1. Low-temperature behaviour of predominantly ferromagnetic magnets 778
   3.2. Bond percolation in dimension $\nu \geq 2$ 782
   3.3. Dilute ferromagnets 795
   3.4. Adding antiferromagnetic couplings 802
   3.5. Spin glasses at low temperatures 808

4. The random field Ising model (RFIM) 821
   4.1. The RFIM, main results 821
   4.2. "Real" magnetic systems which can be mapped onto an RFIM 824
   4.3. On the lower critical dimension of the RFIM 827
   4.4. Interface fluctuations in the RFIM 840
   4.5. The random field spherical model 847

5. Branched polymers and dimensional reduction, *with A. Bovier and U. Glaus* 850
   5.1. Introduction 850
   5.2. Mean field theory 855
   5.3. Intersection probability of two trees 860
   5.4. Mean field bounds for critical exponents and related results 865
   5.5. Flory theory for the exponent ν 871
   5.6. The Parisi–Sourlas dimensional reduction 872
   5.7. Monte Carlo calculation of the critical exponents for the self-avoiding branched polymers in two dimensions 881

Note added in proof 886

References 887

Course 10. The Schrödinger equation with a random potential—A mathematical review, by T.C. Spencer 895

1. Introduction 898
2. One dimension—transfer matrix formalism 904
3. Density of states 911
4. Perturbation theory 918
5. Main technical estimate and absence of absolutely continuous spectrum 920
6. Deterministic estimates on G 923
7. Probabilistic estimates 930
8. Pure point spectrum 935

References 941

Seminars related to Courses 6–10

Seminar 8. Canonical perturbation theory for Anosov diffeomorphisms, by R. de la Llave, J.M. Marco and R. Moriyon 945

Seminar 9. Invariant manifolds of complex analytic mappings near fixed points, by J. Pöschel 949

1. Statement of the result 950
2. Historical notes 952
3. Comparison with the KAM method 953
4. An example 956
5. Proof of the theorem 957

References 963

Seminar 10. Stochastic processes on fibre bundles, by C. DeWitt-Morette 965

Seminar 11. The local Atiyah–Singer index theorem, by E. Getzler 967

Seminar 12. Anderson transition and nonlinear σ-model, by F. Wegner 975

Seminar 13. Density of states in lowest Landau level and supersymmetry, by F. Wegner 977

Seminar 14. The classification of critical exponents in two dimensions; The supersymmetric Kosterlitz–Thouless phase transition, by M. Doria 979

Seminar 15. Instability of tunneling and the concept of molecular structure in quantum mechanics: The case of pyramidal molecules and the enantiomer problem, by P. Claverie and G. Jona-Lasinio 981

Seminar 16. Translation symmetry breaking in Z_N lattice gauge theories as a random surface problem—A brief summary, by C. Borgs 983

Seminar 17. Random surface representation of $U(\infty)$ lattice gauge theory, by I.K. Kostov 987

Seminar 18. Pure and random models of statistical mechanics on hierarchical lattices, by B. Derrida 989

1. Introduction 989
2. Hierarchical lattices 991
3. Zeros of the partition function 994
4. Disorder on hierarchical lattices 996
5. The Harris criterion 997
6. The small-α expansion 998

References 999

Seminar 19. Percolation and random media, by J.T. Chayes and L. Chayes 1001

1. Introduction 1002
   1.1. Bond percolation on $\mathbb{Z}^d$. Mathematical definitions and physical applications 1003
   1.2. Related systems 1007
2. Percolation. General considerations and analysis of $d = 2$ 1010
   2.1. The Harris theorem 1014
   2.2. Rescaling in percolation 1019
   2.3. Decay of correlations and the critical point π_c 1024
   2.4. The Kesten theorem 1032
3. Percolation in $d \geq 3$. A multitude of phases 1039
4. First-passage problems on $\mathbb{Z}^d$ 1049
5. Self-avoiding random walks and random self-avoiding walks 1058
   5.1. General properties 1059
   5.2. Entropy for SAWs 1062
   5.3. Equivalence of the masses 1065
   5.4. Distribution of endpoints 1071
   5.5. Random self-avoiding walks 1076
   Appendix A5. Analyticity properties of the transform functions 1080
6. Random resistors and flow networks 1081
   6.1. The critical point for bulk transport 1084
   6.2. Critical properties of bulk flow 1087
7. Invasion percolation 1090
   7.1. Invasion without trapping 1094
   7.2. Invasion with trapping 1110
8. Random surface models 1116
   8.1. Surface tension in simple models 1118
   8.2. Random tubes 1127
