

## CONTENTS

|                                                              |    |
|--------------------------------------------------------------|----|
| Preface                                                      | v  |
| 1 Introduction                                               | 1  |
| 2 Chaotic behaviour in exactly solvable difference equations | 4  |
| 3 Hamiltonian systems                                        | 12 |
| 3.1 Integrable Hamiltonian systems                           | 12 |
| 3.2 Hamiltonian systems with chaotic behaviour               | 22 |
| 3.2.1 Introduction                                           | 22 |
| 3.2.2 Surface of section technique                           | 23 |
| 3.2.3 Lyapunov exponents for Hamiltonian systems             | 25 |
| 4 Dissipative systems                                        | 30 |
| 4.1 Introduction                                             | 30 |
| 4.2 Integrable dissipative systems                           | 32 |
| 4.3 Dissipative systems with chaotic behaviour               | 35 |
| 5 Hausdorff dimension and capacity                           | 39 |
| 5.1 Definitions                                              | 39 |
| 5.2 Examples                                                 | 42 |
| 6 Attractors                                                 | 49 |
| 6.1 Simple attractors                                        | 49 |
| 6.2 Strange attractors                                       | 52 |
| 7 Anharmonic systems with external periodic forces           | 56 |
| 7.1 Models                                                   | 56 |
| 7.2 Poincaré section                                         | 58 |
| 7.3 Lyapunov exponents                                       | 61 |

|    |                                                     |     |
|----|-----------------------------------------------------|-----|
| 8  | Routes to chaos                                     | 63  |
|    | 8.1 Introduction                                    | 63  |
|    | 8.2 Ruelle Takens Newhouse scenario                 | 68  |
|    | 8.3 Feigenbaum scenario                             | 70  |
|    | 8.4 Pomeau Manneville scenario                      | 72  |
| 9  | Singular point analysis                             | 75  |
|    | 9.1 Introduction                                    | 75  |
|    | 9.2 Method of Sonya Kovalevskaya                    | 76  |
|    | 9.3 Singular point analysis and Painlevé property   | 80  |
|    | 9.4 Singular point analysis and integrability       | 85  |
|    | 9.5 Singular point analysis and chaotic behaviour   | 88  |
|    | 9.6 Self-similar natural boundaries                 | 93  |
| 10 | Space-time chaos                                    | 98  |
| 11 | Electronic circuits for demonstration of chaos      | 109 |
| 12 | Quantum chaos                                       | 115 |
|    | 12.1 Historical remarks                             | 115 |
|    | 12.2 Classical and quantum integrability            | 118 |
|    | 12.3 Distribution of energy eigenvalues             | 122 |
|    | 12.4 Examples                                       | 129 |
|    | 12.5 Hamiltonian operators without classical analog | 133 |
|    | References                                          | 137 |
