CONTENTS

PART I. EQUILIBRIUM THERMODYNAMICS 1

1. THERMODYNAMIC VARIABLES AND PROCESSES 3
   1. Thermodynamic systems 3
   2. The empirical temperature 6
   3. Work processes 9

2. THE BASIC VARIABLES OF THERMODYNAMICS 15
   4. Internal energy 15
   5. Heat 18
   6. The empirical entropy 20
   7. Absolute temperature and entropy 22
   8. Degeneracy of simple systems 26
   9. The second law of thermodynamics 28
   10. Heat capacities, compressibility, and other derivatives 30
   11. Systems in electromagnetic fields 38

3. SYSTEMS INVOLVING INTERNAL VARIABLES 44
   12. Compound systems not in thermal equilibrium 44
   13. The law of entropy increase 47
   14. Homogeneous open systems 50
   15. Characteristic functions 53
   16. Thermodynamic inequalities 57
   17. Equilibrium and stability 59
   18. Chemical equilibria and stability 63
   19. The time variable in thermodynamics 66
   20. Irreversibility 70

4. SYSTEMS POSSESSING INTERNAL DEGREES OF FREEDOM 73
   21. Internal degrees of freedom 74
   22. Kinetic definitions for the independent variables 78
   23. The state equations 79
   24. The Maxwellian distribution function 84
   25. Kinetic entropy 87

5. STATISTICAL THERMODYNAMICS 95
   26. Entropy as a statistical average 96
   27. The principal ensembles of statistical thermodynamics 101
   28. Other ensembles 105
   29. Fluctuation theory 109
   30. Ensembles in phase-space 112
   31. Some applications of Hamiltonians 116
   32. The distributions of quantum statistical mechanics 118
   33. State equations for perfect gases 122
   34. Crystalline solids 128
   35. The thermodynamics of radiation 132
   36. Information theory and thermodynamics 135

PART II. PROCESS THERMODYNAMICS 141

6. GENERAL PRINCIPLES 143
37. The basic equilibrium thermodynamics 143
38. Entropy production rate in a fluid 146
39. Linear constitutive relations 152
40. Constraints on the phenomenological coefficients 156

7. THE RECIPROCAL RELATIONS 162
41. Historical survey 162
42. Proof of the reciprocal relations 164
43. The reciprocal relations of fluctuation theory 169
44. Transformation properties of the reciprocal relations 174
45. Applications of the reciprocal relations 179

8. MATERIAL INVARIANCE AND VISCOSITY 181
46. Central symmetry 181
47. Transverse isotropy 183
48. General isotropy 187
49. Viscosity in an isotropic fluid 191
50. Viscosity in a fluid with transverse isotropy 197

9. FLUID MIXTURES 200
51. The basic entropy inequality for a mixture 200
52. The rate of entropy production in a mixture 205
53. One-fluid equations for a mixture 208
54. Constitutive equations for mixtures 214
55. Minimum entropy production 217

10. MAGNETO-PLASMAS AND SUPERFLUIDS 223
56. Fluid equations for a magneto-plasma 223
57. Wave attenuation in a magneto-plasma 231
58. Fluid equations for liquid helium II 240
59. Dissipative processes in helium II 244
60. Waves in liquid helium II 252
61. Rotating superfluids 254

11. INTERNAL PROCESSES 261
62. Relaxation phenomena 262
63. Dynamic state and constitutive equations 266
64. Linear response theory 270
65. Propagation of sound waves through a relaxing gas 278
66. Processes in an 'internal'space 284

12. THE FLUCTUATION DISSIPATION THEOREM 288
67. Fluctuating internal variables 288
68. The fluctuation–dissipation theorem 295
69. Special cases of the theorem 300
70. The fluctuation–dissipation theorem for adiabatic systems 303

13. KINETIC PROCESSES 308
71. Conservation laws 308
72. The *H*-theorem for kinetic processes 313
73. Simple kinetic constitutive relations 320
74. General kinetic equations 324
75. Boltzmann's equation 334
76. On solving the kinetic equation 342
