**Preface** . . . . . xv

**Notation** . . . . . xix

**CHAPTER 1. ELEMENTS OF DYNAMICS AND ERGODIC THEORY**

1.1. Motion in Phase Space  
*Liouville's theorem. Poincaré's theorem on recurrences. Time of recurrence. Kac's formula, Liouville equation.* . . . . . 1

1.2. Action-Angle Variables  
*What are "convenient" variables? Adiabatic invariance. Oscillations of a nonlinear pendulum. Plasma oscillations. Spectral properties of nonlinear oscillations.* . . . . . 6

1.3. Nonlinear Resonance  
*Resonance induced by an external force. Resonance of coupled oscillations.* . . . . . 12

1.4. Kolmogorov-Arnold-Moser Theory  
*Multidimensional motion. Invariant tori. Action-angle variables. Irreducible contours. Poincaré mappings. Stability theorem. The role of dimensionality of phase space.* . . . . . 22

1.5. Ergodicity and Mixing  
*Basic definitions. Local instability. K systems. Krylov's ideas. Mixing as the condition of finiteness of relaxation time.* . . . . . 28

1.6. Entropy  
*Coarsening of the distribution function. Kolmogorov dynamic entropy. K systems and entropy. Isomorphism of K systems.* . . . . . 35

1.7. Historical Background  
*Foundations of statistical physics. Zermelo's and*

<i>Loschmidt's paradoxes. The viewpoints of Boltzmann and Ehrenfest. More on mixing.</i>	
<i>Krylov's principle of complementarity.</i>	41
Notes to Chapter 1	45

## CHAPTER 2. STOCHASTICITY CRITERION

2.1. Two Models of Mixing	
<i>Continued fractions and stochasticity. Stretching transformation. Steady-state distribution function.</i>	49
2.2. Stochasticity Criterion	
<i>Sinai's criterion. An example of two-dimensional stretching. "Saw-tooth" transformation. Anosov flow.</i>	64
2.3. Collisions of Absolutely Rigid Spheres	
<i>Krylov's analysis. Role played by negative curvature. Difficulties in analyzing the model.</i>	69
2.4. Scattering Billiards (Sinai's Billiards)	
<i>Sinai's analysis of a gas of rigid disks. Problems with scattering billiards. Isomorphism of scattering billiards.</i>	74
Notes to Chapter 2	76

## CHAPTER 3. STOCHASTIC ACCELERATION OF PARTICLES (FERMI ACCELERATION)

3.1. Mechanism of Stochastic Acceleration	
<i>Ulam model. Equations of mappings. Acceleration criterion. Kinetics of acceleration.</i>	79
3.2. Gravitational Engine	
<i>How to use a gravitational field for unlimited acceleration of a body.</i>	86
3.3. Mixing of Skipping Electrons	
<i>Surface electrons in a magnetic field. Stochastic acceleration and scattering billiards. Momentum distribution of surface electrons.</i>	89
Notes to Chapter 3	96

## CHAPTER 4. STOCHASTIC INSTABILITY OF OSCILLATIONS

4.1.	Universal Transformation (Mapping) of Nonlinear Oscillations <i>Derivation of a universal transformation. Why is the “universal transformation” universal? Mixing criterion. Stability islands. Why is there no rigorous theory? Correlation decay time.</i>	97
4.2.	Criterion of Overlapping of Resonances (Chirikov Overlap Criterion) <i>Interaction of resonances. Overlapping of resonances. Relation to the condition of local instability. Importance of the number of resonances.</i>	105
4.3.	Sine Transform <i>Properties of phase trajectories as functions of the stretching parameter. Why is the sine transformation singled out? Stationary distribution function.</i>	110
Notes to Chapter 4		113

## CHAPTER 5. STOCHASTIC LAYER: THEORY OF FORMATION

5.1.	Stochastic Destruction of a Separatrix <i>Peculiarities of motion close to a separatrix. Construction of transformation. Stochasticity condition. Width of stochastic layer.</i>	115
5.2.	Stochastic Layer: Specifics of Formation <i>Qualitative analysis of the region of separatrix destruction. Destruction of nonlinear resonance. Destruction of magnetic surfaces.</i>	119
5.3.	General Pattern of Stochastic Destruction in Phase Space <i>Resonance and stochasticity regions. “Stochasticity quantum” in phase space. Origin of stability islands. Destruction of motion integrals. Remark about Poincaré’s theorem. Two examples: motion of a particle in the field of two plane waves and in the field of a wave packet.</i>	126

5.4.	Homoclinic Structure in the Neighborhood of a Separatrix <i>Splitting of a separatrix. Homoclinic points. More about isomorphism of stochasticity. More about K systems.</i>	133
Notes to Chapter 5		136

## CHAPTER 6. MIXING AND THE KINETIC EQUATION

6.1.	Principles of Kinetic Description <i>Contraction of description. Two methods of contraction. The Master equation. Boltzmann-type equation. Bogolyubov's ideas. Random-phase approximation and the principle of correlation attenuation.</i>	139
6.2.	Kinetics of the Nonlinear Oscillator <i>Perturbation theory for the Liouville equation. Memory of initial conditions. Formal content of the RPA. Method of coarsening the distribution function. Effect of mixing. Time scale.</i>	145
6.3.	Diffusional Motion of a Particle in a Wave-Packet Field <i>Choice of variables. Equation for the distribution function. Approximation of wave packets. Quasilinear equation. Remark on the "trapping" time of a particle.</i>	159
Notes to Chapter 6		165

## CHAPTER 7. NONLINEAR WAVE FIELD

7.1.	The Fermi-Pasta-Ulam Problem <i>Origin and formulation of the problem. Overlapping of resonances and stochasticity threshold.</i>	167
7.2.	Stochastization of a Wave Field <i>Hamiltonian of interacting phonons. Decay spectra. Construction of discrete mapping. Condition of stability and condition of stochasticity. Role played by the number of degrees of freedom. Kolmogorov entropy in multidimensional systems.</i>	172

7.3.	Kinetic Description of a Wave Field <i>Method of the Liouville equation. Loss of memory of initial conditions. Part played by mixing.</i>	186
7.4.	Kinetic Equation for Phonons	191
	Notes to Chapter 7	192

## CHAPTER 8. STOCHASTICITY OF NONLINEAR WAVE

8.1.	Stationary Dynamics of Nonlinear Waves <i>Phase plane. Singularities and solitons. Nonlinear dispersion. Overturning of a wave. Critical velocity. Spectral properties of nonlinear waves.</i>	195
8.2.	Perturbation of Nonlinear Waves <i>Equations for Fourier components. Hamiltonian. Canonical equations of motion. Poisson bracket.</i>	200
8.3.	Nonlinear Resonance <i>Truncated equations. Nonlinear resonance. Modulation of wave parameters. Effect of spatial structure of perturbation.</i>	204
8.4.	Stochastic Instability of Nonlinear Waves <i>Spacing between resonances. Stochasticity conditions. Action-angle variables. Diffusion equation of nonlinear waves.</i>	209
	Notes to Chapter 8	215

## CHAPTER 9. STOCHASTICITY OF QUANTUM SYSTEMS. NONSTATIONARY PROBLEMS (PART I)

9.1.	Quantum K-Systems <i>Comparison of classical and quantum systems. Stability problem. Problem of integrals of motion and integrability. Peculiarities of quasiclassical approximation. Quantum K systems and formulation of the problem.</i>	217
9.2.	Quantum Mappings <i>Mapping in the Schrödinger representation. Mapping of Heisenberg operators. Projecting on two-phase space. Mapping of projections. Non- Markovian mapping of projections.</i>	221

9.3.	Projecting in the Basis of Coherent States <i>Coherent states and their properties. Normal ordering and projecting. Expansion in powers of <math>\hbar</math>. Non-Hamiltonian equations for quantum-mechanical expectation values. Divergence of expansion in <math>\hbar</math>.</i>	226
9.4.	Spreading of Wave Packets <i>Role played by nonlinearity. Time of spreading of a "free" wave packet. Condition of validity of quasiclassical approximation.</i>	232
9.5.	$\hat{T}$ Mapping and Stochasticity Condition (Approximate Analysis) <i>Derivation of <math>\hat{T}</math> mapping. Classical limit. Quantum corrections and <math>\hat{D}</math> forms. Exponential divergence of quantum corrections. Quantum threshold of stochasticity. Quasiclassical region and conditions of its existence.</i>	235
Notes to Chapter 9		244

## CHAPTER 10. STOCHASTICITY OF QUANTUM SYSTEMS. NONSTATIONARY PROBLEMS (Part II)

10.1.	Quantum Mapping of Wave Functions <i>Mapping formulas. Calculation of expectation values. Generalizations.</i>	245
10.2.	Analysis of Quantum Mappings <i>Phase correlations. Local instability. Quantum threshold. Diffusion.</i>	250
10.3.	Interaction of Quantum Resonances <i>Quantum nonlinear resonance in an external field. Effective Hamiltonian. Interaction of two overlapping resonances. Numerical analysis of stochasticity in the case of overlapping resonances.</i>	256
Notes to Chapter 10		269

## CHAPTER 11. KINETIC DESCRIPTION OF QUANTUM K SYSTEMS

- 11.1. Equation for the Density Matrix

	<i>Expansion in powers of perturbation. Separation of the <math>\Phi</math> correlator. Role played by off-diagonal elements of the density matrix.</i>	272
11.2.	<i>Derivation of the Kinetic Equation Green's function in the quasiclassical approximation. "Coarsening" of the density matrix. Decay of the <math>\Phi</math> correlator and attenuation of correlations. Transition to a kinetic description. Example.</i>	276

## CHAPTER 12. DESTRUCTION OF INTEGRALS OF MOTION IN QUANTUM SYSTEMS

12.1.	<i>Historical Background Einstein's quantization rules. Integration on topological orbits. Hypotheses on the spectra of "complex" systems. The Wigner-Porter-Dyson theory.</i>	285
12.2.	<i>Formulation of the Problem Formulation of the problem. Concept of series of levels. Regular and irregular spectra. Concept of "complexity" of a system. Statistical ensemble of levels.</i>	293
12.3.	<i>Universality of K Systems and Periodic Orbits Universality of K systems. Universality scales. Homogeneity of K systems. Periodic trajectories in K systems. An analog of the ergodic theorem for approximate cycles.</i>	296
12.4.	<i>Quantization Rules Summation over periodic orbits. Quantization rules for K systems. Relation to approximate cycles. Relation to intersection theory.</i>	303
12.5.	<i>Distribution of Spacings between Neighboring Levels "Typical" trajectories and orbits. Stability of a random curve. Law of distribution of small spacings between levels. Distribution of large spacings between levels. Results of numerical analysis.</i>	305

12.6.	Some General Remarks on Quantum $K$ Systems <i>On the distribution of eigenvalues. "Can the shape of a drum be heard?" Wave functions and "quasimodes." Concept of "mean" field.</i> . . . . .	316
12.7.	Stochastic Destruction of a Bound State of Atoms and Radiation Field <i>Hamiltonian of field-plus-atoms systems. Resonance approximation and integrals of motion. Destruction of integrals of motion.</i> . . . . .	319
12.8.	Intramolecular Energy Exchange <i>Two limiting cases of energy exchange. Excited molecules. Predissociation and formation of molecular bonding.</i> . . . . .	326
Notes to Chapter 12. . . . .		329
Appendix 1. Mixing Billiards . . . . .		331
Appendix 2. Arnold Diffusion . . . . .		339
Appendix 3. Stochasticity in Dissipative Dynamic Systems . . . . .		343
A3.1.	Stochasticity and Turbulence . . . . .	343
A3.2.	Strange Attractors . . . . .	344
A3.3.	Model of a Strange Attractor . . . . .	345
A3.4.	Distribution Function on a Strange Attractor: Example of a Fractal . . . . .	354
A3.5.	Dimensionality of a Strange Attractor . . . . .	356
A3.6.	Relation between the Model and the Problem of the Generation of Turbulence . . . . .	359
