<i>Preface</i>	V
<i>Chapter 1 Self-consistent fields. Occupation number representations</i>	1
§1 The Hartree self-consistent field	1
§2 Occupation number representation	5
§3 The Hartree–Fock method	18
<i>Chapter 2 Perturbation theory</i>	23
§4 Use of the Hartree–Fock wave functions	23
§5 Time-independent perturbation theory	25
§6 The Goldstone–Hugenholtz method	34
§7 Wick’s theorem: rules for graphs	40
§8 Linked graphs	51
§9 Hartree–Fock energies	55
<i>Chapter 3 Excitations and Green’s functions</i>	57
§10 Single-particle excitations	57
§11 The one-particle Green function	58
§12 Perturbation calculation of Green’s functions	65
§13 Quasiparticles	71
§14 Particle–hole excitations	74
§15 The two-body Green function	78
§16 Density–density correlation function, effective interactions	89
§17 Time-dependent methods	91
Appendix I Current–current correlation functions	95

CONTENTS

Chapter 4 Random-phase approximation

§18 Introduction

§19 Formal development

§20 Method of linearization of the equations of motion

Chapter 5 The Landau theory of Fermi liquids

§21 Introduction

§22 Entropy and specific heat

§23 Galilean invariance and the effective mass

§24 Sound

§25 Zero sound

§26 Spin dependence of the interaction

§27 Incipient ferromagnetism in fermion systems

§28 The vertex function

§29 Summary and general discussion: quasiparticle damping

§30 Transport coefficients

Chapter 6 Phonons and electrons

§31 Phonons

§32 The Debye theory

§33 Electrons in a lattice

§34 Electron-phonon interaction

§35 Coulomb interactions and the 'jellium' model

Chapter 7 Theory of superconductivity

§36 Introduction

§37 The one-pair problem

§38 Strong-coupling model

§39 The quasi-spin formalism

§40 Quasiparticles

§41 Non-degenerate case

§42 Quasiparticle excitations
