

Contents

1 Elements of Quantum Mechanics	1
1. Review of Classical Mechanics	1
2. Vector Spaces and Linear Operators	4
3. Basic Postulates of Quantum Mechanics	9
4. Compatible Observables and Complete Set of Commuting Operators	13
5. Form of the Operators	14
6. Matrix Formalism and Transformation Theory	18
7. General Theory of Angular Momentum	27
8. Time-Independent Perturbation Theory	33
9. Time-Dependent Perturbation Theory	38
2 Elements of Group Theory	44
1. Properties of a Group	44
2. Classes	46
3. Theory of Representations	48
4. Schur's Lemma and Orthogonality Relations	53
5. Characters of a Group	55
6. Properties of the Irreducible Representations of a Group	58
7. The Direct Product Representation	59
8. Product Groups and Their Representations	60
9. Summary of Rules	62
10. Groups of Real Orthogonal Matrices	62
11. Space Groups and Symmetry of Crystalline Solids	68
12. The Irreducible Representations of a Group of Primitive Translations	84
13. The Irreducible Representations of Space Groups	87
3 Connection of Quantum Mechanics with Group Theory	103
1. The Effect of an Orthogonal Coordinate Transformation on the Vectors of a Hilbert Space	103

2.	The Symmetry Group of the Schrödinger Equation	105
3.	The Fundamental Theorem for Functions and Operators Transforming Irreducibly	108
4.	The Construction of Functions Transforming Irreducibly	111
5.	The Full Rotational Group and the Quantum Theory of Angular Momentum	114
6.	The Spin of the Electron and the Double Valued Representations	124
7.	The Kramers' Degeneracy	128
8.	The Symmetric Group of the Hamiltonian and the Pauli Principle	134
4	The Hydrogen Atom	141
1.	The Unperturbed Hamiltonian	141
2.	The Spin-Orbit Interaction	143
3.	The Zeeman Interaction	145
4.	Group Theoretical Considerations for the H Atom	148
5	The Complex Atom: Multiplet Theory	150
1.	The Helium Atom	150
2.	The Many Electron Atom	154
3.	Group Theoretical Considerations for a Complex Atom	160
4.	The Energies of Spectral Terms	164
5.	Hund's Rules and the Principle of Equivalence of Electrons and Holes	171
6.	The Spin-Orbit Splitting of Terms	173
7.	An Example of Spin-Orbit and Zeeman Splitting	176
6	The Magnetic Ion in a Crystal: The Role of Symmetry	179
1.	Bonding in Crystals	179
2.	The Ionic Bond in Crystals	180
3.	Electronic Configurations and Properties of Magnetic Ions	183
4.	The Crystalline Field Hypothesis	193
7	The Weak Field Scheme	199
1.	The Hamiltonian of the Free Ion	199
2.	The Crystal Field Perturbation	200
3.	Application of the Weak Field Scheme	201
4.	Splittings of J Levels in Fields of Different Symmetries	203

8 The Medium Field Scheme	205
1. The Hamiltonian of the Free Ion	205
2. The Crystal Field Perturbation	205
3. The Spin-Orbit Interaction	207
4. An Application of the Medium Field Scheme	208
5. The Method of Operator Equivalents: The Splitting of Transition Metal Ions Levels in an Octahedral Crystal Field	209
9 The Strong Field Scheme	215
1. The Unperturbed Hamiltonian	215
2. The Crystal Field Perturbation	217
3. The Electrostatic Interaction	218
4. The Spin-Orbit Interaction	219
10 Covalent Bonding and Its Effect on Magnetic Ions in Crystals	220
1. The Relevance of Covalent Bonding	220
2. The Formation of Molecular Orbitals	221
3. Example of Molecular Orbitals Formation	224
4. The Use of Projection Operators in the Construction of Molecular Orbitals	234
5. The Formation of Hybrids	238
6. Hybrids of the Central Ion in a Tetrahedral Complex AB_4	242
7. Hybrids of the Central Ion in an Octahedral Complex AB_6	244
8. The Combinations of Ligand Orbitals in an AB_n Complex	245
9. The Energy Levels of an AB_n Complex	249
11 The Quantum Theory of the Radiation Field	257
1. The Classical Electromagnetic Field	257
2. The Quantum Theory of the Electromagnetic Field	260
12 Molecular Vibrations	268
1. The Classical Theory of Molecular Vibrations	268
2. The Symmetry of the Molecules and the Normal Coordinates	272
3. How to Find the Normal Modes of Vibration	273
4. The Use of Symmetry Coordinates	276
5. The Quantum Theory of Molecular Vibrations	279
6. The Selection Rules for Infrared and Raman Transitions. The Fermi Resonance	281
7. The Normal Modes and the Symmetry Coordinates of a Tetrahedral Complex AB_4	284

8. The Normal Modes and the Symmetry Coordinates of an Octahedral Complex AB_6	287
13 Lattice Vibrations	294
1. The Geometry of Crystalline Solids	294
2. Lattice Vibrations of an Infinite Crystal with One Atom per Unit Cell	297
3. Lattice Vibrations of a Finite Crystal with One Atom per Unit Cell	300
4. Lattice Vibrations of a Crystal with more than One Atom per Unit Cell	306
5. Thermodynamics of Phonons	309
6. Phonons and Photons. Similarities and Differences	315
14 The Ion-Photon Interaction: Absorption and Emission of Radiation	317
1. The Ion-Radiation Interaction	317
2. The Expansion of the Interaction Hamiltonian: Different Types of Radiation	319
3. The Density of Final States	321
4. The Transition Probability per Unit Time	322
5. Dipole Radiation	324
6. Selection Rules for Radiative Transitions	326
7. About the Intensities of Radiative Transitions	336
8. The Static Effects of the Interaction Between an Atomic System and the Electromagnetic Field	339
15 The Ion-Vibration Interaction. Radiationless Processes. Thermal Shift and Broadening of Sharp Lines	341
1. The Ion-Vibration Interaction	341
2. Radiationless Processes in Crystals	343
3. Different Types of Line Broadening Mechanisms: Lorentzian and Gaussian Line Shapes	357
4. Theory of Thermal Broadening of Sharp Lines	367
5. Theory of Thermal Line Shift	372
16 Vibrational-Electronic Interaction and Spectra	378
1. Introduction	378
2. Ion-Vibration Interaction in Molecular Complexes	378
3. Vibronic Spectra of Molecular Complexes	380
4. Space Groups and Lattice Vibrations	388
5. Lattice Absorption in Perfect Crystals	396

6. Phonon Activation Due to Impurity Ions in Perfect Crystals	398
7. Selection Rules for Vibronic Transitions Due to Magnetic Impurities in Crystals	401
17 Absorption Spectra of Magnetic Ions in Crystals	404
1. The <i>A</i> and <i>B</i> Coefficients as Related to Magnetic Ions in Crystals	404
2. General Properties of Absorption Spectra	406
3. Absorption Spectra of Magnetic Ions in Crystals	413
4. The Effects of Temperature on Absorption Spectra	418
5. Excited State Absorption	427
18 Fluorescence Spectra of Magnetic Ions in Crystals	432
1. The Fluorescence Emission of Magnetic Ions under Continuous Excitation	432
2. The Response of Fluorescent Systems to Transient Excitation	437
3. General Properties of the Fluorescence Decays in a Multilevel System	442
4. Interactions of Magnetic Ions and Their Effects on the Fluorescence Output	446
5. The Factors Affecting the Fluorescence Emission	460
6. Fluorescence of Magnetic Ions in Crystals	469
19 Elements of Laser Theory	476
1. The Basic Conditions for Laser Amplification	476
2. Noise Considerations in a Laser Amplifier	478
3. The Regenerative Optical Amplifier	480
4. Conditions for Oscillation: Laser Threshold	485
5. Spectral Characteristics of the Laser Emission	489
6. The Three-Level Laser System	491
7. The Four-Level Laser System	494
8. Parameters Affecting the Laser Threshold	497
9. Optical Pumping and Pumping Threshold	499
10. Considerations on the Output of Laser Systems	504
11. Pulsations in Lasers	511
Appendix 1. Tables of Characteristics of Optically Pumped Solid State Lasers	515
Appendix 2. Bibliography on Laser Materials	532
Author Index	533
Subject Index	537
