PREFACE	v
-------------------	---

Chapter I

The Phenomenon of Superconductivity

1. The Thermodynamic Transition	1
2. The Meissner-Ochsenfeld Effect	4
3. Further Phenomenology of the Meissner Effect	10
4. The Critical Field	16
5. Surface Energy and Ginzburg-Landau Theory	19
6. Persistent Ring Currents	24
7. Flux Quantization	31
8. The Energy Gap	33
9. Coulomb Interactions between Electrons	35
10. The Fröhlich Interaction and the Isotope Effect	39

Chapter II

The Bose-Einstein Gas Model

1. The Bose-Einstein Distribution, Normal State	45
2. The Bose-Einstein Condensation	51
3. The Two-Fluid Model	59
4. The Meissner Effect at Zero Temperature	63
5. The Critical Field of the Ideal Bose Gas, at Zero Temperature	70
6. Magnetic Behavior of the Bose Gas Model at Non-Zero Temperature	76
7. Other Properties of the Bose Gas Model	79

Chapter III

The Quasi-Chemical Equilibrium Theory

1. The Concept of Electron Pairs as Quasi-Molecules	83
2. Thermodynamics of Chemical Equilibrium	88
3. Electron Pairs and the Three-Fluid Model	93
4. Correlation Functions and the Virial Expansion: Classical Treatment	98
5. Correlation Functions and the Virial Expansion: Quantum Treatment	103

CONTENTS

6. Correlation Functions and Chemical Equilibrium	108
7. Statistical Correlations in the Degenerate Ideal Fermi Gas	116
8. Quasi-Chemical Equilibrium in a Degenerate Fermi Gas	122
9. Schafroth Condensation of Electron Pairs	129

Chapter IV**Self-consistent Treatment of the Ground State**

1. Variational Derivation of the BCS-Bogoliubov Integral Equation	140
2. Solution of the Integral Equation	147
3. The Critical Field at Zero Temperature	152
4. The Pippard Coherence Distance.	157

Chapter V**The BCS and Bogoliubov Theories, at Zero Temperature**

1. Creation and Destruction Operators	167
2. The BCS Theory at Zero Temperature	174
3. The Bogoliubov Transformation Applied to the Fröhlich Model	185
4. The Relationship between the Bogoliubov and BCS Ground States	195
5. Renormalization of the Bogoliubov Theory. Upper Limit on ρ	199
6. The Criterion for Superconductivity	208

Chapter VI**Excitation Spectrum and Thermodynamics.
The Theory of Bogoliubov, Zubarev, and Tserkovnikov**

1. The Excitation Spectrum near the Ground State	217
2. The Specific Heat at Low Temperatures	221
3. The Theory of Bogoliubov, Zubarev, and Tserkovnikov	227
4. Solution of the Integral Equation. The Transition Temperature and the Isotope Effect	238
5. The Specific Heat and the Critical Field	242
6. The Meaning of a Temperature-Dependent Hamiltonian	250
7. Transport Phenomena Involving Bogolon Excitations	252

Chapter VII**Thermodynamics in the Quasi-Chemical Equilibrium Theory**

1. Introduction	261
2. The Trial Density Matrix of the Quasi-Chemical Equilibrium Theory . .	264
3. Repulsive Correlations and the "Lifetime Problem"	270
4. Reduction from a Three-Fluid to a Two-Fluid Model.	273
5. Relationship to the BZT Theory	277

Chapter VIII**The Meissner Effect**

1. Introduction	281
2. Expectation Values over General Pairing Wave Functions	283
3. Gauge Invariance	286
4. Variational Equation for the Pair Wave Function	291
5. The Linear Magnetic Response	293
6. Intensive and Extensive Perturbation Theory	297
7. The Knight Shift, and Other Problems	301

Chapter IX**Persistent Currents**

1. Introduction	307
2. Quantum Theory of Normal Conductivity	310
3. The Effect of Bose-Einstein Condensation	315
4. The Applied Field	318
5. The Pseudo-Gauge Transformation	321
6. Single-Particle States in a Ring, with and without Scattering Centers	324
7. Flux Quantization upon Cooling	331
8. Build-up of the Ring Current by Electromagnetic Induction	333
9. The Critical Current	336
10. Unsolved Problems.	341

Chapter X**Further Problems**

1. Introduction	345
2. Hard Superconductors and the Intermediate State	346
3. Superconducting Alloys and Compounds	356
4. Superconducting Thin Films	362
5. Conclusion	370

Appendix A**Some Concepts from Statistical Mechanics**

1. Ensembles and Entropy	371
2. Equilibrium Ensembles (1) The Microcanonical Ensemble	376
3. Equilibrium Ensembles (2) The Canonical Ensemble	379
4. Equilibrium Ensembles (3) The Grand Canonical Ensemble	386
5. The Fermi-Dirac and Bose-Einstein Distributions	393
6. Minimum Principles in Statistical Mechanics.	396

Appendix B**Mathematical Formulation of the Quasi-Chemical Equilibrium Theory**

1. The Husimi Theory	403
2. Trial Density Matrix with Pair Correlations	408
3. The Quenching Identity and Expectation Values	411
4. The Dyson Transformation	418
5. Specialization to One Pair State Only	423
