| Translator's Introduction | 1 |
|-------------------------------------|---|

PART I

THEORY OF GASES WITH MONATOMIC MOLECULES, WHOSE DIMENSIONS ARE NEGLIGIBLE COMPARED TO THE MEAN FREE PATH.

| | |
|---|----|
| Foreword | 21 |
| Introduction | 23 |
| 1. Mechanical analogy for the behavior of a gas | 23 |
| 2. Calculation of the pressure of a gas | 30 |

CHAPTER I

THE MOLECULES ARE ELASTIC SPHERES. EXTERNAL FORCES AND VISIBLE MASS MOTION ARE ABSENT.

| | |
|--|-----|
| 3. Maxwell's proof of the velocity distribution law; frequency of collisions | 36 |
| 4. Continuation; values of the variables after the collision; collisions of the opposite kind. | 43 |
| 5. Proof that Maxwell's velocity distribution is the only possible one | 49 |
| 6. Mathematical meaning of the quantity H | 55 |
| 7. The Boyle-Charles-Avogadro law. Expression for the heat supplied | 62 |
| 8. Specific heat. Physical meaning of the quantity H | 68 |
| 9. Number of collisions | 75 |
| 10. Mean free path | 82 |
| 11. Basic equation for the transport of any quantity by the molecular motion | 87 |
| 12. Electrical conduction and viscosity of the gas | 91 |
| 13. Heat conduction and diffusion of the gas | 98 |
| 14. Two kinds of approximations; diffusion of two different gases | 104 |

CHAPTER II

THE MOLECULES ARE CENTERS OF FORCE. CONSIDERATION OF EXTERNAL FORCES AND VISIBLE MOTIONS OF THE GAS.

| | |
|---|-----|
| 15. Development of partial differential equations for f and F | 110 |
| 16. Continuation. Discussion of the effects of collisions | 114 |
| 17. Time-derivatives of sums over all molecules in a region | 123 |
| 18. More general proof of the entropy theorem. Treatment of the equations corresponding to the stationary state | 131 |

| | |
|--|-----|
| 19. Aerostatics. Entropy of a heavy gas whose motion does not violate Equations (147). | 141 |
| 20. General form of the hydrodynamic equations | 147 |

CHAPTER III

THE MOLECULES REPEL EACH OTHER WITH A FORCE INVERSELY PROPORTIONAL TO THE FIFTH POWER OF THEIR DISTANCE.

| | |
|---|-----|
| 21. Integration of the terms resulting from collisions | 161 |
| 22. Relaxation time. Hydrodynamic equations corrected for viscosity. Calculation of B_5 using spherical functions | 172 |
| 23. Heat conduction. Second method of approximate calculations | 182 |
| 24. Entropy for the case when Equations (147) are not satisfied. Diffusion | 197 |

PART II

VAN DER WAALS' THEORY; GASES WITH COMPOUND MOLECULES; GAS DISSOCIATION; CONCLUDING REMARKS.

| | |
|-------------------|-----|
| Foreword. | 215 |
|-------------------|-----|

CHAPTER I

FOUNDATIONS OF VAN DER WAALS' THEORY.

| | |
|---|-----|
| 1. General viewpoint of van der Waals. | 217 |
| 2. External and internal pressure | 220 |
| 3. Number of collisions against the wall | 221 |
| 4. Relation between molecular extension and collision number | 222 |
| 5. Determination of the impulse imparted to the molecules | 224 |
| 6. Limits of validity of the approximations made in §4 | 226 |
| 7. Determination of internal pressure | 227 |
| 8. An ideal gas as a thermometric substance | 230 |
| 9. Temperature-pressure coefficient. Determination of the constants of van der Waals' equation. | 231 |
| 10. Absolute temperature. Compression coefficient. | 234 |
| 11. Critical temperature, critical pressure, and critical volume | 236 |
| 12. Geometric discussion of the isotherms | 240 |
| 13. Special cases | 243 |

CHAPTER II

PHYSICAL DISCUSSION OF THE VAN DER WAALS' THEORY.

| | |
|--|-----|
| 14. Stable and unstable states | 246 |
| 15. Undercooling. Delayed evaporation | 248 |
| 16. Stable coexistence of both phases | 250 |
| 17. Geometric representation of the states in which two phases coexist | 253 |
| 18. Definition of the concepts gas, vapor, and liquid | 256 |

| | |
|---|-----|
| 19. Arbitrariness of the definitions of the preceding section | 257 |
| 20. Isopycnic changes of state | 259 |
| 21. Calorimetry of a substance following van der Waals' law | 261 |
| 22. Size of the molecule | 264 |
| 23. Relations to capillarity | 265 |
| 24. Work of separation of the molecules. | 268 |

CHAPTER III

PRINCIPLES OF GENERAL MECHANICS NEEDED FOR GAS THEORY.

| | |
|---|-----|
| 25. Conception of the molecule as a mechanical system characterized by generalized coordinates. | 271 |
| 26. Liouville's theorem. | 274 |
| 27. On the introduction of new variables in a product of differentials | 278 |
| 28. Application to the formulas of §26. | 283 |
| 29. Second proof of Liouville's theorem | 285 |
| 30. Jacobi's theorem of the last multiplier | 290 |
| 31. Introduction of the energy differential | 294 |
| 32. <i>Ergoden</i> | 297 |
| 33. Concept of the momentoid | 300 |
| 34. Expression for the probability; average values | 304 |
| 35. General relationship to temperature equilibrium | 310 |

CHAPTER IV

GASES WITH COMPOUND MOLECULES.

| | |
|---|-----|
| 36. Special treatment of compound molecules | 313 |
| 37. Application of Kirchhoff's method to gases with compound molecules | 315 |
| 38. On the possibility that the states of a very large number of molecules can actually lie within very narrow limits | 317 |
| 39. Treatment of collisions of two molecules | 319 |
| 40. Proof that the distribution of states assumed in §37 will not be changed by collisions | 323 |
| 41. Generalizations | 325 |
| 42. Mean value of the kinetic energy corresponding to a momentoid | 327 |
| 43. The ratio of specific heats, κ | 331 |
| 44. Value of κ for special cases | 332 |
| 45. Comparison with experiment | 334 |
| 46. Other mean values | 336 |
| 47. Treatment of directly interacting molecules | 338 |

CHAPTER V

DERIVATION OF VAN DER WAALS' EQUATION

BY MEANS OF THE VIRIAL CONCEPT.

| | |
|---|-----|
| 48. Specification of the point at which van der Waals' mode of reasoning requires improvement | 341 |
|---|-----|

| | |
|--|-----|
| 49. More general concept of the virial | 342 |
| 50. Virial of the external pressure acting on a gas | 344 |
| 51. Probability of finding the centers of two molecules at a given distance | 346 |
| 52. Contribution to the virial resulting from the finite extension of the molecules. | 350 |
| 53. Virial of the van der Waals cohesion force | 352 |
| 54. Alternatives to van der Waals' formulas | 354 |
| 55. Virial for any arbitrary law of repulsion of the molecules. | 356 |
| 56. The principle of Lorentz's method | 358 |
| 57. Number of collisions | 361 |
| 58. More exact value of the mean free path. Calculation of W' according to Lorentz's method. | 364 |
| 59. More exact calculation of the space available for the center of a molecule | 365 |
| 60. Calculation of the pressure of the saturated vapor from the laws of probability | 367 |
| 61. Calculation of the entropy of a gas satisfying van der Waals' assumptions, using the calculus of probabilities | 370 |

CHAPTER VI

THEORY OF DISSOCIATION.

| | |
|--|-----|
| 62. Mechanical picture of the chemical affinity of monovalent similar atoms. | 376 |
| 63. Probability of chemical binding of an atom with a similar one. | 379 |
| 64. Dependence of the degree of dissociation on pressure | 383 |
| 65. Dependence of the degree of dissociation on temperature. | 385 |
| 66. Numerical calculations | 389 |
| 67. Mechanical picture of the affinity of two dissimilar monovalent atoms | 393 |
| 68. Dissociation of a molecule into two heterogeneous atoms. | 396 |
| 69. Dissociation of hydrogen iodide gas | 398 |
| 70. Dissociation of water vapor | 399 |
| 71. General theory of dissociation | 402 |
| 72. Relation of this theory to that of Gibbs. | 406 |
| 73. The sensitive region is uniformly distributed around the entire atom | 408 |

CHAPTER VII

SUPPLEMENTS TO THE LAWS OF THERMAL EQUILIBRIUM IN GASES WITH COMPOUND MOLECULES.

| | |
|---|-----|
| 74. Definition of the quantity H , which measures the probabilities of states | 412 |
| 75. Change of the quantity H through intramolecular motion | 414 |
| 76. Characterization of the first special case considered | 415 |
| 77. Form of Liouville's theorem in the special case considered | 417 |
| 78. Change of the quantity H as a consequence of collisions | 419 |
| 79. Most general characterization of the collision of two molecules | 422 |

| | |
|---|-----|
| 80. Application of Liouville's theorem to collisions of the most general kind | 424 |
| 81. Method of calculation with finite differences | 427 |
| 82. Integral expression for the most general change of H by collisions | 431 |
| 83. Detailed specification of the case now to be considered | 432 |
| 84. Solution of the equation valid for each collision | 433 |
| 85. Only the atoms of a single type collide with each other | 435 |
| 86. Determination of the probability of a particular kind of central motion | 437 |
| 87. Characterization of our assumption about the initial state | 441 |
| 88. On the return of a system to a former state | 443 |
| 89. Relation to the second law of thermodynamics. | 444 |
| 90. Application to the universe | 446 |
| 91. Application of the probability calculus in molecular physics | 448 |
| 92. Derivation of thermal equilibrium by reversal of the time direction | 450 |
| 93. Proof for a cyclic series of a finite number of states | 453 |
| Bibliography. | 454 |
| Index | 483 |
