PREFACE	v
ACKNOWLEDGMENTS	vi
Chapter 1	
INTRODUCTION	1
Chapter 2	
COLLISIONS BETWEEN ATOMS	6
Introduction. Collision Kinetics. Collisions influenced by the interatomic forces. Comparison of the real collision with a hard sphere collision. The interatomic potential. The form of the scattering law for a realistic potential. Approximations to the exact scattering law. Asymptotic trajectory approximation. Matching Potential approximation. Hard sphere approximation.	
The potential $(V(r) = A \left(\frac{a^1}{r} - 1 \right))$ and other truncated potentials. The impulse approximation. Deduction of the interatomic potential from scattering measurements. Validity criteria for the use of classical mechanics. Inelastic collisions. Condition for isolated collision model. Collective interactions.	
Chapter 3	
SECONDARY ELECTRON EMISSION	38
Introduction. Early research. Development of a theoretical model of secondary emission. Recent work on potential ejection. Recent work on kinetic ejection. Conclusion.	
Chapter 4	
SECONDARY ION EMISSION	75
Introduction. Early research. Excited atom emission. Charged particle emission; qualitative studies. Ionic emission coefficients. Reflection coefficients ρ, K_+ . Secondary emission coefficient R. Dependence of ionic emission coefficients on incident ion charge. Dependence of ionic emission coefficients on angle of incidence. Single crystal studies. Ejected ions; energies and spatial distributions. Inelastic collisions. Effects of target temperature on ionic yield. Theoretical treatments of ionic emission.	
Chapter 5	
THE PENETRATION OF IONS	97
Introduction. Range quantities. The mean free path assumption. The specific energy loss method. The consistent hard sphere method. The operator method. Transport theory. The diffusion model. Ranges in real lattices. Machine calculations. Experimental range measurements. Other evidence for channelling in crystals. Comparison of theoretical and experimental range determinations.	

Chapter 6

RADIATION DAMAGE

204

Introduction. Lattice defects. Theories of the rate of defect production. Computer techniques. Experimental observations of damage.

Chapter 7

SPUTTERING

310

Introduction. Early research. Recent research. General trends. Effect of Bombardment Duration on results. Angular dependence of sputtering. Threshold energies. Sputtering at high energies. Sputtering of alloys. Sputtering of insulators. Concerning material sputtered. Single crystal studies. Effect of Target Temperature. Surface studies. Sputtering theories. Sputtering in space. Conclusion.

Chapter 8

ION TRAPPING & GAS RELEASE PROCESSES.

354

Introduction. Basic experimental techniques. Initial trapping efficiencies. Bombardment trapping curves. The maximum trapped quantities of gas. Bombardment induced gas emission. Thermally activated release processes. Mechanisms of gas release. The location of trapped gas. Bubble formation and migration.

Chapter 9

ION BOMBARDMENT TECHNIQUES AND APPLICATION

423

Introduction. Production of ion beams. Applications of ion bombardment. Secondary ion emission for analysis of surface conditions and target materials.

Index

443
