

CONTENTS

Preface	vii
Introduction, by A.W. Czanderna	1
Chapter 1. The aspects of sputtering in surface analysis methods, by G.K. Wehner	5
I. Introduction	5
II. The sputtering process	7
A. Survey	7
B. Sputtering yields	9
C. Sputter etching	15
D. Composition changes caused by ion bombardment	18
E. The ratio of sputtered ions/neutrals	26
III. Specific particle bombardment aspects	27
A. In ISS	27
B. In SIMS	30
C. In ESCA and AES	32
IV. Outlook	33
References	35
Chapter 2. A comparison of the methods of surface analysis and their applications, by D. Lichtman	39
I. Introduction	39
II. Classification of the methods for surface analysis by the incident particles used to produce an output of detectable particles	41
A. Thermal input with neutrals out	41
B. Electrons in	42
1. Electrons out, 43 — 2. Ions out, 48 — 3. Neutrals out, 51 — 4. Photons out, 52	
C. Ions in	52
1. Ions out, 53 — 2. Neutrals out, 56 — 3. Electrons out, 57 — 4. Photons out, 57	
D. Photons in	58
1. Photons out, 59 — 2. Electrons out, 61 — 3. Neutrals out, 61 — 4. Ions out, 62	
E. Neutrals in	62
1. Neutrals out, 63 — 2. Ions out, 63 — 3. Electrons out, 63 — 4. Photons out, 63	
III. Electric and magnetic fields in	64
A. Electric and magnetic fields out	64
B. Electrons out	66
IV. Surface waves in	69
A. Neutrals out	69
V. Conclusions	70
References	70

Chapter 3. Low-energy ion scattering spectrometry, by T.M. Buck	75
I. Introduction	75
A. General remarks	75
B. Historical	76
C. Comparison with ion scattering at higher energies	78
II. Experimental equipment	79
A. General requirements	79
B. Ion source	81
C. Vacuum system and scattering chamber	81
D. Electrostatic analyzer and ion detector	82
III. Ion scattering principles	84
A. Kinematics	84
B. Scattered yield	85
C. Ion neutralization	86
IV. Surface composition analysis	90
A. Calibration	90
B. Technological applications	92
V. Surface structure	93
A. Shadowing effects	93
B. Double and plural scattering, surface defect analysis	95
VI. Conclusions	98
Note added in proof	99
References	100

Chapter 4. Surface analysis by X-ray photoelectron spectroscopy, by W.M. Riggs and M.J. Parker	103
I. Introduction	103
II. Fundamentals	106
A. X-ray absorption	106
B. Qualitative analysis	107
C. Quantitation	108
III. Chemical shifts	114
A. Organic structural information	115
B. Inorganic structural and chemical information	117
IV. Instrumentation	123
A. Introduction	123
B. X-ray sources	123
C. Electron energy analyzers	129
D. Detectors	133
E. Vacuum system	133
F. Sample handling	134
G. Data acquisition and processing	135
V. Some experimental variables	136
A. Charging effects	136
B. Charge compensation	136
C. Depth profiling via ion etching	138
D. Grazing angle ESCA	140
VI. Applications	142
A. Organic surfaces	142
1. Reactions at polymer surfaces, 143 — 2. Wool fiber surfaces, 145 —	
3. Lubricants at surfaces, 145 — 4. Ion exchange at surfaces, 146	
B. Inorganic surfaces	146
1. Metal/metal oxide films, 146 — 2. Electrode passivation, 147 — 3. Chemi-	

	sorption on metals, 147 — 4. Airborne particulates, 147 — 5. Glass surfaces, 147	
	C. Catalysis	148
VII.	Summary	156
	References	157
Chapter 5.	Auger electron spectroscopy, by A. Joshi, L.E. Davis and P.W. Palmberg	159
I.	Introduction	159
II.	Fundamentals	160
	A. The Auger process	161
	B. Auger electron escape depth	163
	C. Core level ionization probabilities by electron impact	164
	D. Matrix effects	165
III.	Experimental methods	169
	A. Electron energy analysis	169
	B. Signal-to-noise considerations	171
	C. Thin film analysis	172
	D. Scanning Auger microscopy	175
IV.	Quantitative analysis	180
	A. Basic mechanisms and absolute measurements	180
	B. Measurements with external standards	181
	C. Measurements with elemental sensitivity factors	183
	D. Experimental results	184
V.	Applications	187
	A. Fundamental surface science	187
	1. Identification of anomalous structures, 187 — 2. Adsorption—desorption studies, 188 — 3. Surface segregation, 189 — 4. Surface reactions, 193	
	B. Metallurgy and materials science	194
	1. Surface properties, 194 — 2. Grain boundary phenomena, 199	
	C. Catalytic activity	209
	D. Semiconductor technology	212
	1. Failure analysis, 212 — 2. Process evaluation, 216	
	References	218
Chapter 6.	Secondary ion mass spectrometry, by J.A. McHugh	223
	Nomenclature	223
I.	Introduction	223
II.	Secondary ion emission	228
	A. Mechanism	230
	B. Secondary ion yields	232
	C. Secondary ion species	233
	D. Incident ion effects	236
III.	SIMS instrumentation	240
	A. Instrument concepts	240
	1. Instruments providing no lateral surface characterization, 242 — 2. Instruments that provide lateral information through probe imaging, 242 — 3. Direct imaging instrument, 243	
	B. Detection sensitivity	244
	C. Trace analysis	247
	D. Ion imaging	250
	E. Primary ion beam considerations	252
	F. Mass spectrometric analysis of the sputtered neutral component	253
IV.	Quantitation	254

V.	Elemental depth concentration profiling	259
	A. Instrumental factors influencing profile depth resolution	261
	B. Ion—matrix effects influencing profile depth resolution	263
VI.	Applications	266
	A. Surface studies	266
	B. Depth profiles	269
	C. XY characterization, micro and bulk analysis	271
VII.	Conclusions	272
	References	273

Chapter 7. The use of Auger electron spectroscopy and secondary ion mass spectrometry in the microelectronic technology, by J.M. Morabito and R.K. Lewis

	Lewis	279
I.	Introduction	279
II.	Sample selection	280
	A. Tantalum thin films	280
	B. Doped (B,P,As) silicon	280
III.	Selection of inert or reactive primary ion bombardment in AES and SIMS profiling	281
IV.	Sputtering rate measurements and depth resolution in AES and SIMS profiling	283
V.	Chemical analysis of sputtered tantalum thin films by AES and SIMS	284
VI.	Quantitative analysis of sputtered tantalum films intentionally doped with nitrogen, carbon, and oxygen by AES and SIMS	290
VII.	Analysis of P-doped Ta ₂ O ₅ films by AES and SIMS	296
VIII.	Analysis of platinum films containing phosphorus by AES and SIMS	300
IX.	Analysis of alumina ceramic substrates by AES and SIMS	303
X.	Chemical analysis of P-, As-, and B-doped silicon by SIMS and AES	305
	A. Phosphorus	305
	B. Arsenic	307
	C. Boron	309
XI.	In-depth, bulk, and surface sensitivity comparison of AES and SIMS	312
XII.	Anomalous ion yield effects produced at the surface in SIMS depth profiles	314
XIII.	The use of high energy and low energy secondary ion discrimination in SIMS	318
XIV.	Summary and conclusions	320
	A. Sputtering ion beam	321
	B. Sputtering rate	322
	C. Mass and spectral interferences	322
	D. Surface analysis	323
	E. In-depth analysis (> 500 Å)	323
	F. Depth resolution	325
	G. Quantitative analysis	325
	References	326

Chapter 8. The atom-probe field ion microscope, by E.W. Müller

I.	Introduction	329
II.	Principles of atom-probes	331
III.	Models of field ionization and field evaporation	331
IV.	The TOF atom-probe	334
	A. Design considerations	334
	B. Detectors	336
	C. Pulsers	338
	D. Time-of-flight read-out	339
	E. Mass resolution	341

	F. Ion energy deficits	343
	G. Energy deficit compensation	349
	H. The energy focusing atom-probe	350
V.	A 10 cm TOF atom-probe	354
VI.	A magnetic sector atom-probe	356
VII.	New phenomena observed with the atom-probe	358
	A. Multiply charged ions	358
	B. Field adsorption of the imaging gases	360
	C. Metal—noble gas compound ions	361
	D. Ions from the forbidden zone	365
	E. Surface interactions with molecular gases	367
	F. A field calibration via free-space ionization	370
VIII.	Metallurgical applications	372
	References	375

Chapter 9. Field ion mass spectrometry applied to surface investigations, by J.H.

Block in cooperation with A.W. Czanderna 379

I.	Introduction	379
II.	Experimental methods	381
	A. The field emitter	381
	B. The field ion source	384
	C. Mass separators	386
	1. Magnetic sector instruments, 386 — 2. Resonance mass separators, 387 —	
	3. Time-of-flight analysis of field ions, 390	
	D. Energy analysis of field ions	393
	E. Ion detectors	395
III.	Mechanisms of ion formation	396
	A. Field ionization	396
	B. Proton transfer	396
	C. Charge-transfer and intermolecular interactions	398
	D. Heterolytic bond cleavage	401
	E. Ion—molecule reactions	402
IV.	The identification of surface interactions	404
	A. Surface selectivity of field ions	405
	B. Appearance potentials	407
	C. Pulsed fields	409
V.	Field induced surface reactions	410
	A. Field induced adsorption	410
	B. Field induced desorption	411
	C. Thermodynamic equilibria	413
	D. Field polymerization and fragmentation	415
	E. Field desorption of surface complexes	417
VI.	Surface reactions without field perturbation	420
	A. Carbonium ions on surfaces	421
	B. Chemical reactions without electric momentum	424
VII.	Applications of FIMS	427
	A. Reactions of water	427
	B. The analysis of evaporation products of solids	431
	1. Evaporation of solid selenium, 431 — 2. Evaporation of arsenic oxide	
	modifications, 435	
	C. Nitrogen compounds at metal surfaces	438
	References	443

Chapter 10. Infrared reflection—absorption spectroscopy, by H.G. Tompkins	447
I. Introduction	447
II. Theory	448
A. History	448
B. Single reflection	448
1. Intuitive picture, 449 — 2. Calculations, 450	
C. Absorption band magnification	452
1. Scale expansion, 453 — 2. Multiple reflections, 454	
III. Applicability	457
A. Film effects	457
B. Substrate effects	459
C. Combining substrate and film effects	459
IV. Experimental arrangements	462
A. Concepts	462
B. Typical arrangements	463
1. Multiple reflections, 463 — 2. Single reflection sample design, 466 —	
3. General considerations, 466	
V. Applications of RA spectroscopy	467
VI. Summary	469
References	472
Index	473
