Contents

Preface v

Introduction 1

1 Nonlinear mathematical models of continuous media 7
- 1.1 Nonlinear theory of continuous media 7
  - 1.1.1 Basic principles 7
  - 1.1.2 Constitutive theory 11
- 1.2 Mathematical models 15
  - 1.2.1 Auxiliary assumptions 15
  - 1.2.2 Mathematical models in differential form 16
  - 1.2.3 Mathematical models in integral form 23
  - 1.2.4 Matrix form 25

2 Preliminary analysis of wave propagation 26
- 2.1 Nonlinear effects 26
  - 2.1.1 Transient waves 26
  - 2.1.2 Shock formation and Riemann invariants 30
  - 2.1.3 Equivalent analysis in Eulerian and Lagrangian systems of coordinates 31
- 2.2 Effects caused by finite velocity of heat propagation 34
  - 2.2.1 Mathematical model 34
  - 2.2.2 Harmonic waves 36

3 Ray method in theory of nonlinear waves 40
- 3.1 Basic equations and propositions 40
  - 3.1.1 Statement of the problem 40
  - 3.1.2 Partial problems 46
- 3.2 Noncoupled evolution equations 50
  - 3.2.1 One-dimensional waves 50
  - 3.2.2 Multi-dimensional waves 55
  - 3.2.3 Properties of evolution equations 59

3.3 Coupled evolution equations 63
3.3.1 Coupled systems 63
3.3.2 Interaction of waves 65

4 One-dimensional waves in an elastic medium 68
4.1 Longitudinal waves 68
4.1.1 Propagation of longitudinal waves 68
4.1.2 Interaction of longitudinal waves 71
4.2 Longitudinal and transverse waves 73
4.3 Cylindrical and spherical waves 76

5 One-dimensional waves in viscoelastic and thermoelastic media 78
5.1 Evolution equations in a viscoelastic medium 78
5.2 Evolution equations in a thermoelastic medium 81
5.3 Solution of evolution equations 83
5.3.1 Analytical solutions 83
5.3.2 Numerical solutions 89

6 One-dimensional waves in a dispersive medium 93
6.1 Evolution equations 93
6.1.1 Medium with a microstructure 93
6.1.2 Geometrical dispersion 95
6.1.3 Medium with relaxation 97
6.2 Solutions 104
6.2.1 Steady wave solutions 104
6.2.2 Transient solutions 108
6.2.3 Dispersion 117

7 One-dimensional waves in an inhomogeneous medium 124
7.1 Evolution equations 124
7.1.1 General theory 124
7.1.2 Continuous medium 126
7.1.3 Rod of variable cross-section 130
7.2 Solutions of evolution equations 131
7.2.1 Analytical solutions 131
7.2.2 Numerical solutions 135

8 Two-dimensional waves 139
8.1 Evolution equations 139
8.1.1 Descartes' coordinates 139
8.1.2 Cylindrical coordinates 144
8.1.3 General forms of two-dimensional evolution equations 147

8.2 Solutions of evolution equations 149
8.2.1 Analytical solutions 149
8.2.2 Numerical solutions 155
8.2.3 Dispersion 156

9 Shock waves 164
9.1 Basic equations 164
9.1.1 Kinematical and dynamical conditions 164
9.1.2 Constitutive equations 165
9.1.3 Velocity 167
9.1.4 Description of discontinuities 168
9.2 One-dimensional waves 169
9.2.1 Nonlinear elastic medium 169
9.2.2 Nonlinear thermoelastic medium 170
9.2.3 Nonlinear relaxing medium 172
9.3 Multi-dimensional waves 176
9.3.1 General equations 176
9.3.2 Asymptotic analysis 178

10 Applications 184
10.1 Waves in layered media 184
10.1.1 Evolution equations 184
10.1.2 Interaction of incident and reflected waves 190
10.2 Inverse problems 192
10.2.1 General theory 192
10.2.2 Examples 195
10.3 Electromagnetic waves 204
10.3.1 Remarks on general theory 204
10.3.2 Hodgkin–Huxley equations 206
10.3.3 Hyperbolic equations for signal transmission in nerve fibres 208
