

## CONTENTS

	page
Preface .....	3
1. Introduction: Object of the lectures; essential hypothesis .....	5
2. Basic concepts – Atomic structure .....	7
3. Atoms spectra .....	9
4. General equations: transport equations for the gas .....	12
5. Radiative energy transfer equation .....	15
6. Cross-sections for the interactions between photons and material particles	20
a. Interaction in the bound-bound processes .....	20
b. Interaction in the bound-free processes .....	26
c. The interaction in the free-free processes .....	30
7. The formal solution of the equation of radiative energy transfer .....	32
8. Radiative contribution to the transport of momentum, energy and mass .	32
9. Relative contributions of the radiative and collisional terms in the momentum, energy and mass transport and limit forms of the radiative contributions to the momentum and energy equations .....	44
a. Rosseland approximation (or diffuse approximation) .....	44
b. Planck approximation (or emission approximation) .....	47
c. General case .....	49
10. Boundary conditions .....	57
a. Boundary condition at infinity .....	57
b. Boundary condition on a surface. Reflectivity, absorptivity, transparen- cy .....	58
c. Einstein photoelastic effect. Determination of the source function $S_\nu$ ..	62
d. Determination of the biangular reflectance .....	68
e. Electric field near a surface of a metal .....	69
11. Simple applications .....	71
a. Excitation to the first energy level from the ground level .....	71
b. Ionization from the ground state .....	77
References .....	81
