
Contents

Notation	xv
1. The Problem of High-Temperature Superconductivity (General Review)	
1. Introduction	1
2. The Nature and Mechanisms of Superconductivity. High-Temperature Superconductivity (Formulation of the Problem)	4
3. Some Remarks on the Computation of the Critical Temperature	12
4. The Exciton Mechanism of Superconductivity (The Generalized "Jellium" Model; General Considerations)	21
5. Ways of Producing High-Temperature Superconductors (Some Possibilities and Applications)	28
6. Conclusion	40
2. The Critical Temperature of a Superconducting System	
1. Introduction	41
2. The Interelectron Interaction and the Permittivity	45
3. Equation for the Critical Temperature	59
4. The Critical Temperature	71
5. Applications to the Problem of High-Temperature Superconductivity (General Conclusions)	84
3. The Electron-Phonon Interaction in Metals and the Problem of Lattice Stability	
1. Introduction	91
2. The Fröhlich Model	94
3. The Adiabatic Approximation	100
4. The Plasma Model	103
5. Self-Consistent Description of the Electron-Phonon System of a Metal	115
4. Superconductivity in Three-Dimensional Quasiisotropic Systems	
1. Introduction	133
2. Description of the Superconducting State in a Quasiisotropic Three-Dimensional System	136

3. The Critical Temperature of Superconductors with Strong Electron-Phonon Interaction	143
4. Computation of the Electron-Phonon Coupling Constant in Metals	154
5. Dependence of the Critical Temperature on the Properties of the Normal Metal	161
6. Superconductivity and Lattice Instability	171
7. Possibility of a Nonphonon Mechanism of Superconductivity in Three-Dimensional Systems	174
5. Possibility of an Increase in the Critical Temperature as a Result of a Structural-Transition-Induced Change in the Electron Spectrum	
1. Introduction	179
2. The Ground State of a Semimetal in the Presence of Simultaneous Electron-Hole and Electron-Electron Pairings	185
3. Incompatibility of the Superconducting and Dielectric Pairings in the Case when the Electron and Hole Fermi Surfaces Coincide in Shape and Size	189
4. Coexistence of the Dielectric and Superconducting Pairings in a Doped Semimetal	193
5. Conclusion	204
6. Electronic Properties and Superconductivity of Layered Crystals	
1. Introduction	213
2. The Structure and Physical Properties of Layered Metals	215
3. The Critical Temperature of Layered Superconductors	220
4. Intercalation and the Problem of High-Temperature Superconductivity	223
5. Fluctuations in Two-Dimensional and Quasi-Two-Dimensional Systems	230
6. Specific Character of the Superconducting Properties of Layered Crystals with the Josephson Interlayer Interaction	233
7. Conclusion	238
7. Structural and Superconducting Properties of Systems with One-Dimensional Anisotropy	
1. Introduction	241
2. The Peierls Transition in Square-Planar Complexes	245
3. TCNQ Salts with Asymmetric Cations	258
4. The Peierls Transition in TCNQ Salts with Symmetric Cations	267
5. Metallic Systems without Metal Atoms	273
6. Superconductivity in Quasi-One-Dimensional and Organic Crystals	277
8. Superconducting Systems of the "Sandwich" Type	
1. Introduction	283
2. Estimates of the T_c for "Sandwiches" in Certain Models	289
3. Surface Effects in Layered Structures	309

9. Superconductivity under Nonequilibrium Conditions	
1. Introduction	315
2. The Possibility of the T_c 's Rising under the Action of an External Field	317
3. Superconductivity under Nonequilibrium Conditions in the Presence of Repulsive Interelectron Interaction	326
4. Some Properties of Superconductors with an Inverted Population	336
5. Anomalous Paramagnetism in a Nonequilibrium Superconductor	338
6. Conclusion	340
