PART I. DIFFERENTIAL GEOMETRY . . . . .	1
<b>1. Differentiable Manifolds . . . . .</b>	<b>4</b>
<b>2. Tangent Vectors, Vector and Tensor Fields . . . . .</b>	<b>9</b>
2.1 The Tangent Space . . . . .	9
2.2 Vector Fields . . . . .	15
2.3 Tensor Fields . . . . .	17
<b>3. The Lie Derivative . . . . .</b>	<b>21</b>
3.1 Integral Curves and Flow of a Vector Field . . . . .	21
3.2 Mappings and Tensor Fields . . . . .	22
3.3 The Lie Derivative . . . . .	24
<b>4. Differential Forms . . . . .</b>	<b>27</b>
4.1 Exterior Algebra . . . . .	27
4.2 Exterior Differential Forms . . . . .	29
4.3 Derivations and Antiderivations . . . . .	30
4.4 The Exterior Derivative . . . . .	32
4.5 Relations Among the Operators $d$ , $i_X$ and $L_X$ . . . . .	34
4.6 The $*$ -Operation and the Codifferential . . . . .	36
4.6.1 Oriented Manifolds . . . . .	36
4.6.2 The $*$ -Operation . . . . .	37
4.6.3 The Codifferential . . . . .	40
4.7 The Integral Theorems of Stokes and Gauss . . . . .	42
4.7.1 Integration of Differential Forms . . . . .	42
4.7.2 Stokes' Theorem . . . . .	44
<b>5. Affine Connections . . . . .</b>	<b>47</b>
5.1 Covariant Derivative of a Vector Field . . . . .	47
5.2 Parallel Transport Along a Curve . . . . .	49
5.3 Geodesics, Exponential Mapping, Normal Coordinates . . . . .	50
5.4 Covariant Derivative of Tensor Fields . . . . .	51
5.5 Curvature and Torsion of an Affine Connection, Bianchi Identities . . . . .	54
5.6 Riemannian Connections . . . . .	57
5.7 The Cartan Structure Equations . . . . .	61

5.8	Bianchi Identities for the Curvature and Torsion Forms . . . . .	64
5.9	Locally Flat Manifolds . . . . .	68
5.10	Table of Important Formulae . . . . .	70
 <b>PART II. GENERAL THEORY OF RELATIVITY . . . . .</b>		<b>75</b>
 <b>Introduction . . . . .</b>		<b>77</b>
 <b>Chapter 1. The Principle of Equivalence . . . . .</b>		<b>81</b>
1.1	Characteristic Properties of Gravitation . . . . .	81
1.1.1	Strength of the Gravitational Interaction . . . . .	81
1.1.2	Universality of the Gravitational Interaction . . . . .	82
1.1.3	Precise Formulation of the Principle of Equivalence . . . . .	82
1.1.4	Gravitational Red Shift as Evidence for the Validity of the Principle of Equivalence . . . . .	83
1.2	Special Relativity and Gravitation . . . . .	85
1.2.1	The Gravitational Red Shift is not Consistent with Special Relativity . . . . .	85
1.2.2	Global Inertial Systems Cannot be Realized in the Presence of Gravitational Fields . . . . .	86
1.2.3	The Deflection of Light Rays . . . . .	86
1.2.4	Theories of Gravity in Flat Space-Time . . . . .	87
1.3	Space and Time as a Lorentzian Manifold, Mathematical Formulation of the Principle of Equivalence . . . . .	87
1.4	Physical Laws in the Presence of External Gravitational Fields . . . . .	89
1.4.1	Motion of a Test Body in a Gravitational Field and Paths of Light Rays . . . . .	90
1.4.2	Energy and Momentum Conservation in the Presence of an External Gravitational Field . . . . .	91
1.4.3	Electrodynamics . . . . .	93
1.4.4	Ambiguities . . . . .	95
1.5	The Newtonian Limit . . . . .	96
1.6	The Red Shift in a Static Gravitational Field . . . . .	97
1.7	Fermat's Principle for Static Gravitational Fields . . . . .	99
1.8	Geometric Optics in a Gravitational Field . . . . .	100
1.9	Static and Stationary Fields . . . . .	104
1.10	Local Reference Frames and Fermi Transport . . . . .	111
1.10.1	Precession of the Spin in a Gravitational Field . . . . .	111
1.10.2	Fermi Transport . . . . .	113
1.10.3	The Physical Difference Between Static and Stationary Fields . . . . .	115
1.10.4	Spin Rotation in a Stationary Field . . . . .	117
1.10.5	Local Coordinate Systems . . . . .	118

<b>Chapter 2. Einstein's Field Equations</b>	123
2.1 Physical Meaning of the Curvature Tensor	123
2.2 The Gravitational Field Equations	127
2.3 Lagrangian Formalism	135
2.3.1 Hamilton's Principle for the Vacuum Field Equations	136
2.3.2 Another Derivation of the Bianchi Identity and its Meaning	138
2.3.3 Energy-Momentum Tensor in a Lagrangian Field Theory	140
2.3.4 Analogy with Electrodynamics	143
2.3.5 Meaning of the Equation $\nabla \cdot T = 0$	144
2.3.6 Variational Principle for the Coupled System	145
2.4 Nonlocalizability of the Gravitational Energy	146
2.5 The Tetrad Formalism	147
2.6 Energy, Momentum, and Angular Momentum of Gravity for Isolated Systems	154
2.7 Remarks on the Cauchy Problem	160
2.8 Characteristics of the Einstein Field Equations	163
 <b>Chapter 3. The Schwarzschild Solution and Classical Tests of General Relativity</b>	 166
3.1 Derivation of the Schwarzschild Solution	166
3.2 Equation of Motion in a Schwarzschild Field	173
3.3 Advance of the Perihelion of a Planet	176
3.4 Bending of Light Rays	178
3.5 Time Delay of Radar Echoes	182
3.6 Geodetic Precession	186
3.7 Gravitational Collapse and Black Holes (Part 1)	189
3.7.1 The Kruskal Continuation of the Schwarzschild Solution	190
3.7.2 Spherically Symmetric Collapse to a Black Hole	200
Appendix: Spherically Symmetric Gravitational Fields	208
 <b>Chapter 4. Weak Gravitational Fields</b>	 214
4.1 The Linearized Theory of Gravity	214
4.2 Nearly Newtonian Gravitational Fields	219
4.3 Gravitational Waves in the Linearized Theory	220
4.4 The Gravitational Field at Large Distances from the Source	226
4.5 Emission of Gravitational Radiation	233
 <b>Chapter 5. The Post-Newtonian Approximation</b>	 242
5.1 The Field Equations in the Post-Newtonian Approximation	242
5.2 Asymptotic Fields	249
5.3 The Post-Newtonian Potentials for a System of Point Particles	252

5.4	The Einstein-Infeld-Hoffmann Equations . . . . .	255
5.5	Precession of a Gyroscope in the PN-Approximation . . .	261
5.6	The Binary Pulsar . . . . .	266
5.6.1	Pulse Arrival-Time Data and their Analysis . . . . .	266
5.6.2	Relativistic Effects . . . . .	268
5.6.3	Gravitational Radiation . . . . .	270
5.6.4	The Companion Star . . . . .	271

**PART III. RELATIVISTIC ASTROPHYSICS . . . . . 277**

<b>Chapter 6. Neutron Stars . . . . .</b>	<b>280</b>	
6.1	Order-of-Magnitude Estimates . . . . .	281
6.2	Relativistic Equations for Stellar Structure . . . . .	286
6.3	Stability . . . . .	290
6.4	The Interior of Neutron Stars . . . . .	293
6.4.1	Qualitative Overview . . . . .	293
6.4.2	Ideal Mixture of Neutrons, Protons, and Electrons . . . .	294
6.5	Models for Neutron Stars . . . . .	297
6.6	Bounds on the Mass of Nonrotating Neutron Stars . . . .	299
6.6.1	Basic Assumptions . . . . .	299
6.6.2	Simple Bounds for Allowed Cores . . . . .	301
6.6.3	Allowed Core Region . . . . .	302
6.6.4	Upper Limit for the Total Gravitational Mass . . . . .	304
6.7	Cooling of Neutron Stars . . . . .	305
6.7.1	Introduction . . . . .	305
6.7.2	Thermodynamic Properties of Neutron Stars . . . . .	306
6.7.3	Neutrino Emissivities . . . . .	313
6.7.4	Cooling Curves . . . . .	318
6.8	Addendum 1: Ground State Energy of Macroscopic Matter . . . . .	321
6.8.1	Stability of Matter with Negligible Self-Gravity . . . . .	321
6.8.2	Nonsaturation of Gravitational Forces . . . . .	324
6.8.3	Newton vs. Coulomb . . . . .	327
6.8.4	Semirelativistic Systems . . . . .	328
6.9	Addendum 2: Core Collapse Models of Type II Supernova Explosions . . . . .	330
6.9.1	Some Observational Facts . . . . .	330
6.9.2	Presupernova Evolution of Massive Stars . . . . .	332
6.9.3	The Physics of Stellar Collapse . . . . .	338
6.9.4	Numerical Studies . . . . .	344
6.10	Addendum 3: Magnetic Fields of Neutron Stars, Pulsars .	348
6.10.1	Introduction . . . . .	348
6.10.2	Magnetic Dipole Radiation . . . . .	352
6.10.3	Synchrotron Radiation from the Crab Nebula . . . . .	354

6.10.4	The Pulsar Magnetosphere . . . . .	355
6.10.5	Matter in Strong Magnetic Fields . . . . .	358
<b>Chapter 7. Rotating Black Holes . . . . .</b>		<b>361</b>
	Introduction . . . . .	361
7.1	Analytic Form of the Kerr-Newman Family . . . . .	362
7.2	Asymptotic Field and $g$ -Factor of a Black Hole . . . . .	362
7.3	Symmetries of $g$ . . . . .	364
7.4	Static Limit and Stationary Observers . . . . .	364
7.5	Horizon and Ergosphere . . . . .	365
7.6	Coordinate Singularity at the Horizon, Kerr Coordinates . . . . .	367
7.7	Singularities of the Kerr-Newman Metric . . . . .	367
7.8	Structure of the Light Cones . . . . .	367
7.9	Penrose Mechanism . . . . .	368
7.10	The Second Law of Black Hole Dynamics . . . . .	369
7.11	Remarks on the Realistic Collapse . . . . .	371
<b>Chapter 8. Binary X-Ray Sources . . . . .</b>		<b>373</b>
8.1	Brief History of X-Ray Astronomy . . . . .	373
8.2	Mechanics of Binary Systems . . . . .	374
8.3	X-Ray Pulsars . . . . .	377
8.4	Bursts . . . . .	379
8.5	Cyg X-1: A Black Hole Candidate . . . . .	382
8.6	Evolution of Binary Systems . . . . .	386
<b>Chapter 9. Accretion onto Black Holes and Neutron Stars . . . . .</b>		<b>388</b>
9.1	Spherically Symmetric Accretion onto a Black Hole . . . . .	389
9.1.1	Adiabatic Flow . . . . .	389
9.1.2	Thermal Bremsstrahlung from the Accreting Gas . . . . .	395
9.2	Disk Accretion onto Black Holes and Neutron Stars . . . . .	400
9.2.1	Introduction . . . . .	400
9.2.2	Basic Equations for Thin Accretion Disks (Non-Relativistic Theory) . . . . .	401
9.2.3	Steady Keplerian Disks . . . . .	406
9.2.4	Standard Disks . . . . .	410
9.2.5	Stability Analysis of Thin Accretion Disks . . . . .	419
9.2.6	Relativistic Keplerian Disks . . . . .	425
Appendix: Nonrelativistic and General Relativistic Hydrodynamics of Viscous Fluids . . . . .		432
A. Nonrelativistic Theory . . . . .		432
B. Relativistic Theory . . . . .		436
