

CONTENTS

Preface	ix
I. Probing the Stars' Chemical Composition	
1. Introduction	3
2. The Luminosities of the Stars	5
3. The Radii of the Stars; Their Temperatures and Spectra	8
4. The Masses of the Stars	14
5. The Mass-Luminosity Relation	22
6. The Hertzsprung-Russell Diagram	31
7. The Hydrogen Content of Stellar Interiors	46
8. The Spectra of Stars in Clusters	55
9. The Composition of the Sun's Atmosphere	62
10. The Composition of Atmospheres of Normal Stars	67
11. Anomalous Abundances	77
12. Summary	96
II. Some Problems of Stellar Evolution	
1. The Energy Content of the Stars	98
2. The Transformation of H into He	101
3. The Formation of Stars in Interstellar Clouds	105
4. Evolution through Expansion	115
5. Evolution through Rotational Breakup	120
6. Stellar Rotation	123
7. The Evolution of Pleione	133
8. The Cosmogonical Theory of C. F. v. Weizsaecker	143
9. Two Evolutionary Paths	148
10. Conclusions	150
III. The Origin and Development of Close Double Stars	
1. Frequency of Binaries	154
2. The Ellipticity Effect	164
3. Axial Rotation of Close Binaries	166
4. Classification of Eclipsing Binaries	169
5. The Two Principal Groups of Binaries	171
6. The Spectra of the W Ursae Majoris Binaries	175
7. Variable Line Intensities in Spectroscopic Binaries	182

8. Gaseous Rings in Close Binary Systems	189
9. Typical Spectroscopic Binaries	195
10. Summary of Observational Results on Spectroscopic Binaries	228
11. The Evolution of Close Double Stars	
12. Peculiar Binaries	232
Index	260
