

Contents

INTRODUCTION	xiii
Scope of the book. Plasma. Plasmas in space. The origin of space plasmas. Methods of studying plasmas.	
1. IONOSPHERES	1
Discovery of the ionosphere. Limitations of ground-based observations. The formation of an ionized layer. The solar ionizing radiation. The ionospheric regions. The ionospheres of Mars and Venus. The potential of a spacecraft. The Langmuir probe on a spacecraft. An electron temperature probe. The mass spectrum and temperature of ionospheric ions. Distribution of ions in the topside ionosphere. Some other ionospheric studies.	
2. MAGNETOSPHERES	28
Discovery of the Earth's radiation belts. The geomagnetic trapping of energetic particles. Azimuthal drift of trapped particles. The magnetospheric plasma. The solar wind. The plasmopause. Magnetic storms and aurorae. Suprathermal particle analysers. Magnetic-field measurements. Electric-field measurements. The Sun-Earth relationship.	
3. THE ATMOSPHERE OF THE SUN	53
Why study the Sun? Looking into the solar atmosphere. The need for spacecraft. Solar activity. An ultraviolet solar spectrograph. The Sun as an X-ray star. A proportional-counter solar X-ray spectrometer. The energy of a solar flare. An X-ray 'spectroheliograph'. Skylab.	
4. COSMIC X-RAY ASTRONOMY	74
Beyond the X-ray curtain. Early discoveries. Large-area detectors for sky surveys. The signal/noise problem. A multi-wire proportional counter. Binary mask systems. X-ray reflecting telescopes. Position-sensitive X-ray detectors. The identification of X-ray sources. The astrophysics of X-ray sources. X-ray astronomy and cosmology.
