

INDICE

R. A. RICCI and C. SALVETTI – Preface	pag.	xv
Gruppo fotografico dei partecipanti al Corso		fuori testo
E. TELLER – Enhanced nuclear-reactor safety	pag.	1
E. TELLER – Nuclear energy for space propulsion.....	»	5
M. SILVESTRI – Nuclear power from fission	»	11
1. Primary energy requirements in the next century	»	14
2. Economic improvements in the generation of electricity through nuclear power.....	»	15
2'1. Reduction in the cost of nuclear fuels	»	15
3. Present costs of electricity from different primary energy sources	»	17
4. Breeding <i>vs.</i> nonbreeding, fast <i>vs.</i> thermal reactors	»	17
5. Safety to-day and tomorrow	»	18
6. Passive and/or inherently safe reactors	»	19
7. The problem of the disposal of the nuclear weapons	»	20
G. VENDRYES – Breeding of nuclear fuel and basic characteristics of fast-neutron reactors.		
1. Breeding of nuclear fuel	»	21
2. Basic characteristics of fast-neutron reactors	»	25
G. VENDRYES – Technical aspects of fast breeder reactors with special reference to safety	»	31

G. VENDRYES – Past development, present situation and future prospects of fast breeder reactors	pag.	45
R. CARLE – The French experience with nuclear power.		
Introduction	»	55
PART I. – The French nuclear programme	»	56
1. Nuclear energy in France: its long history	»	56
2. The French nuclear programme: a product, an industry	»	58
3. The organization of French industry	»	61
4. The fuel cycle industry	»	63
PART II. – Industrial policy	»	65
1. Standardization policy	»	66
2. Limits of standardization	»	66
3. Organization of EdF for the nuclear programme	»	69
4. Mobilization of men and organization of tasks	»	70
5. Quality management	»	72
6. Scheduling	»	73
PART III. – What do we mean by good operation	»	76
1. Improving availability	»	76
1'1. Making improvements	»	77
1'2. Reduce the frequency of unplanned shutdowns	»	77
1'3. Reduce the length of planned shutdowns	»	77
2. Meeting grid requirements	»	78
2'1. Operating experience	»	79
3. Helping the operator	»	80
3'1. The advanced control room	»	80
3'2. Control room organization	»	81
4. Training of operating staff	»	81
4'1. Types of training	»	81
4'2. Teaching methods	»	82
4'3. Plant control and function simulators	»	84
4'4. EdF training statistics	»	85
PART IV. – Energy policy and opinion	»	86
1. The advantages of nuclear energy	»	86
1'1. Nuclear energy brings independence	»	86
1'2. Nuclear energy is ecological	»	87
1'3. Nuclear power is economical	»	88
1'4. Nuclear electricity guarantees price stability	»	89
2. Nuclear energy after Chernobyl	»	89
2'1. Chernobyl: unacceptable and excluded disaster	»	90
3. Nuclear power and public opinion	»	91
3'1. Regaining confidence	»	92
3'2. Communications under crisis conditions	»	94

PART V. – Today and tomorrow	pag.	96
1. Safety levels—satisfactory but still perfectible.....	»	96
1'1. Operating experience	»	96
1'2. Precursor incidents.....	»	96
1'3. Severity scale for incidents and accidents	»	96
1'4. Human factors	»	98
1'5. WANO, World Association of Nuclear Operators.....	»	98
2. Safety of future reactors.....	»	99
2'1. First point: We do not have to start all over again with a clean slate	»	99
2'2. Second point: We should not aim at eliminating operator inter- vention and replacing him by automatic control circuits	»	100
2'3. Third point: Beware of the utopia of a «riskless» power plant	»	100
2'4. Last point: How big should we make the reactors of the future?.....	»	101
3. Choosing the next type of reactors	»	101
3'1. Prerequisites for success	»	101
3'2. Common rules of safety	»	102
3'3. International cooperation	»	102
3'4. Fast breeder reactors	»	103
3'5. Mastering the fuel cycle	»	104
3'6. Maintaining industrial capacities	»	104
Conclusion.....	»	104

F. L. PARKER – Radioactive-waste management.

1. Introduction	»	107
2. Waste risings	»	112
2'1. Mining.....	»	112
2'2. Milling.....	»	112
2'3. Low-level waste	»	113
2'4. High-level waste	»	113
2'5. Repositories	»	116
3. Discussion	»	122
3'1. Public trust.....	»	122
3'2. Risk perception	»	122
3'3. Compensation.....	»	125
4. Conclusions.....	»	126

J. J. TAYLOR – New concepts in power reactors in the USA.

Introduction	»	131
1. Utility goals	»	131
1'1. The need for base load capacity	»	132
1'2. Prerequisites for the nuclear option	»	135
1'3. Standardization	»	136
1'4. The technological choice for increased nuclear capacity.....	»	137
1'5. Stability and cooperation in R&D funding.....	»	138
1'6. Summation of utility goals.....	»	139

2. Utility requirements	pag. 139
3. Design characteristics of U.S. advanced nuclear plants.....	» 143
3'1. Introduction	» 143
3'2. The passive PWR, AP-600	» 144
3'3. The passively stable BWR	» 147
4. The advanced liquid-metal-cooled reactor.....	» 148
5. The advanced modular gas-cooled reactor	» 152
5'1. An historical perspective on passive reactor features	» 154
6. Probabilistic safety assessment and emergency planning	» 157
6'1. Progress in technical understanding.....	» 157
6'2. Core damage frequency	» 158
6'3. Accident progression.....	» 158
6'4. Containment performance	» 159
6'5. Severe-accident source terms.....	» 160
6'6. Off-site consequences.....	» 162
Conclusion.....	» 162

M. CUMO – Innovative reactors: a proposal. The MARS (Multipurpose Advanced Reactor inherently Safe).

1. A new approach in design criteria selection	» 169
2. Main fluid systems	» 172
2'1. Reactor and core cooling primary system	» 172
2'2. Safety core-cooling system - SCCS (or emergency core-cooling system)	» 176
2'3. Pressurized containment for primary-system protection (CPP) ..	» 177
2'4. Auxiliary systems	» 179
2'4.1. Pressurized containment heat removal system (CPPHR) ..	» 179
2'4.2. Chemical and volumetric control system (CVCS)	» 179
2'4.3. Other auxiliary systems	» 180
3. Scram systems	» 181
4. Nuclear design	» 182
4'1. Special check valves	» 184
5. Plant arrangement.....	» 186
5'1. Reactor building.....	» 186
5'2. Other buildings	» 189

G. SILINI – The rationale of the system of dose limitation recommended by the International Commission on Radiological Protection (ICRP).

1. Introduction	» 193
2. Quantities and units.....	» 194
3. The concept of detriment	» 195
4. Radiation effects	» 195
4'1. Immediate somatic (deterministic) effects	» 195
4'2. Effects of antenatal exposure	» 196
4'3. Late somatic (stochastic) effects.....	» 197
4'4. Hereditary (stochastic) effects	» 201

5. Tissue weighting factors.....	pag.	203
6. The main objectives of radiation protection	»	204
7. The system of radiological protection	»	206
8. Special applications	»	210
8'1. Medical exposure.....	»	210
8'2. Public exposure	»	210
8'3. Pre-existing exposures.....	»	211
9. Conclusions	»	212

F. NIEHAUS and L. LEDERMAN – Trends in nuclear safety.

1. New challenges for nuclear safety	»	213
2. Comparative risk assessment.....	»	213
3. Developing new safety concepts	»	218
4. Striving for excellence	»	219
4'1. Safety principles for NPPs	»	219
4'2. Improving plant analysis capabilities	»	220
5. Monitoring safety	»	222
5'1. «Living» PSA.....	»	222
5'2. Safety indicators	»	224
6. Operational experience feedback	»	225
6'1. International nuclear event scale (INES)	»	225
6'2. Incident reporting system (IRS).....	»	225
6'3. Assessment of safety significant event teams (ASSET)	»	226
7. Probabilistic safety criteria	»	228
8. Conclusions	»	230

F. NIEHAUS – Nuclear power and sustainable development. The issue of climate change.

1. Introduction	»	233
2. Population growth.....	»	233
3. Primary energy consumption in developing countries	»	233
4. Electricity consumption	»	236
5. Environmental protection	»	237
6. CO ₂ emissions and climate change	»	238
7. The role of nuclear power	»	239
8. Conclusions	»	241

C. MARCHETTI – On society and nuclear energy.

Executive summary.....	»	243
The results of the study	»	244
1. Setting the problem.....	»	245
1'1. Is this the end of the nuclear era?.....	»	245
2. Conceptual and methodological guidelines	»	246

3.	Three situations to consider	pag.	248
3'1.	Sixteenth Century witch hunts	»	248
3'2.	The Waldheim case	»	250
3'3.	Beduins and the Medina railway.....	»	251
4.	Legislative activity as an indicator of public interest	»	251
5.	Nuclear energy and the Kondratieff cycles.....	»	258
6.	The media	»	265
6'1.	The US case	»	265
6'2.	The «Der Spiegel» case.....	»	271
7.	Are nuclear accidents really stochastic? The case of the USA.....	»	275
8.	Nuclear power plants, the media and the accidents: an analysis of the USA	»	278
8'1.	The plants.....	»	278
	Appendix A. – Mathematical appendix	»	282
A'1.	The Malthusian case	»	282
A'2.	One-to-one competition.....	»	284
A'3.	Multiple competition	»	285
	Appendix B. – Der Spiegel's «Green Monster».....	»	285
	Appendix C. – Opposition to farm machinery and thresher destruction in England in 1830	»	289
	Appendix D. – Railways	»	291
	Appendix E. – Fluoridation: pro and con	»	295

J. DE BOER – Do we need more physics? Do we need more physicists?
Do we need more nuclear physics?

1.	More physics?	»	303
2.	More physicists?.....	»	304
3.	More nuclear physics?.....	»	304
4.	Summary	»	305

P-H. REBUT and the JET Team – JET results and the approach to a fusion reactor.

1.	Introduction	»	307
2.	Machine performance	»	308
3.	Scientific results and achievements	»	309
3'1.	Density	»	310
3'2.	Temperature.....	»	312
3'3.	Energy confinement.....	»	313
3'4.	Beta limits	»	315
3'5.	Alpha-particle simulations	»	316
3'6.	Impurities	»	317
3'7.	Fusion performance	»	318
3'8.	Summary of scientific achievements.....	»	319
4.	Planned new phase for JET	»	320
4'1.	Key concepts of the JET pumped divertor	»	320
4'2.	Modelling impurity control.....	»	321
4'3.	The pumped divertor configuration.....	»	322

5. Planned schedule	pag.	323
6. Conditions required in a reactor	»	324
7. The Next Step.....	»	325
8. Conclusions	»	328

E. BERTOLINI – The JET project: key experimental results and technical development towards breakeven plasmas.

List of symbols	»	331
Introduction	»	332
PART I. – The past.....	»	334
I.1. Ohmic heating (1983-84).....	»	334
1'1. Machine conditions.....	»	334
1'2. Technical achievements	»	335
1'3. Scientific achievements.....	»	335
I.2. Additional heating (1984-86).....	»	337
2'1. Machine conditions.....	»	337
2'2. Technical achievements	»	339
2'3. Scientific achievements.....	»	339
2'4. Main scientific findings	»	340
I.3. Performance upgrading (1986-88).....	»	341
3'1. Machine conditions.....	»	341
3'2. Technical achievements	»	344
3'3. Scientific achievements.....	»	345
3'4. Main scientific findings	»	348
PART II. – The present and the future	»	349
II.1. Passive control of impurities (1988-91).....	»	349
1'1. Machine conditions.....	»	349
1'2. Technical achievements	»	352
1'3. Scientific achievements.....	»	352
1'4. Main scientific findings	»	355
1'5. Future development (1990-91).....	»	357
1'6. Expected performance (1991).....	»	357
II.2. Active control of impurities (1991-94).....	»	357
2'1. The pumped divertor (1992-94).....	»	358
2'1.1. Main components of the divertor.....	»	358
2'1.2. Other divertor-related components.....	»	358
2'1.3. Other components	»	360
2'2. Main objective of the divertor phase	»	360
II.3. Experiments with deuterium and tritium (1994-96).....	»	361
3'1. Remote handling	»	361
3'2. Tritium plant.....	»	362
3'3. Diagnostics.....	»	362
II.4. JET planning	»	362
II.5. Other large tokamaks and JET	»	363
5'1. Tokamak fusion test reactor (TFTR).....	»	363
5'2. Doublet III - upgraded (DIII-D)	»	364

5.3. Japanese tokamak - 60 (JT-60)	pag. 365
5.4. Comparison between the large tokamaks	» 365
Conclusions	» 366

B. COPPI and F. PEGORARO – Near-term experiments on advanced fusion.

1. Introduction	» 371
2. The Ignitor experiment	» 372
3. Physics considerations	» 375
3.1. Density and confinement time issues	» 375
3.2. Plasma purity and divertor issues	» 378
4. «Neutronless» fusion burn experiment.	» 379
5. The Candor experiment	» 380

R. TOSCHI – The NET project.

1. NET objectives.	» 387
2. NET parameters and expected performance	» 387
2.1. Plasma energy confinement	» 388
2.2. Plasma purity.	» 388
2.3. Mode of operation	» 389
3. Phased operation	» 389
4. Basic machine concept.	» 390
5. Status of data base and R&D needs	» 392
5.1.	» 392
5.2.	» 392
5.3.	» 392
6. Conclusion.	» 393

J. MEYER-TER-VEHN – Physics of inertial fusion.

1. The ICF concept.	» 395
2. A fusion target imploded by heavy ions	» 397
3. Gain model.	» 401
3.1. The ignition spark and its radius R_s	» 402
3.2. The cold-fuel reservoir and its isentrope α	» 402
3.3. Hydrodynamic efficiency η and gain	» 403
3.4. Gain curves $G(E_{\text{beam}}; \eta, \alpha, R_s)$	» 404
4. Analytic theory of spherical implosion.	» 406
4.1. Kidder's isentropic implosion solution	» 407
4.2. Scale symmetry of ideal-gas dynamics	» 408
4.3. Self-similar compression waves.	» 410
5. Implosion symmetry by indirect drive	» 413
5.1. Hohlraum physics	» 414
5.2. Hohlraum target for heavy-ion fusion	» 417
5.3. An X-ray driven implosion	» 419
6. Achievements and future perspectives.	» 420

R. BOCK – Status and perspectives of heavy-ion inertial fusion.

1. Introduction	pag. 425
2. Some facts about heavy-ion inertial fusion	» 426
3. Driver accelerators and system studies	» 429
3'1. The induction linac scenario	» 430
3'2. The r.f. linac scenario	» 431
3'2.1. HIBALL: Concept and critical issues	» 431
3'2.2. Cost estimates	» 434
4. Future research at GSI	» 436
5. Perspectives	» 441
6. Conclusions	» 444

A. BERTIN and A. VITALE – Experimental frontiers in muon-catalyzed fusion.

1. Introduction	» 449
2. Increasing the cycle rate	» 453
2'1. The q_{1S} parameter	» 453
2'2. The hyperfine quenching	» 454
2'3. Epithermal effects	» 454
2'4. Short survey of the present experimental information	» 455
2'5. Concluding remarks	» 456
3. Decreasing muon losses in the catalytic cycle	» 457
3'1. Introductory remarks	» 457
3'2. Indirect measurements of W_s^{eff}	» 459
3'3. Direct measurements of $W_s^{eff} = \omega_s$ for $d\mu t$ fusion processes	» 461
4. Decreasing the muon cost	» 463
5. Conclusions	» 465

F. SCARAMUZZI – State of the art of «cold fusion».

1. Introduction	» 471
2. Short history and general information	» 472
3. Heat excess experiments	» 474
4. Neutron detection	» 476
5. Tritium detection	» 480
6. Some «nonstandard» experiments	» 481
6'1. Cluster-impact «lukerwarm» fusion	» 481
6'2. Ion implantation experiments	» 481
6'3. Neutron emission in chemical reactions	» 486
7. Theories	» 486
8. Conclusions	» 487
