

CONTENTS

PREFACE	v
ABBREVIATIONS	xv
I. STARTING POINT AND PRELIMINARIES	1
1. Scope of the book	1
2. Description of the Neutron Distribution	4
3. Neutron Cross-Sections (XS)	8
3.1 Reaction Rates	12
3.2 Differential Cross-Sections	14
3.3 Nuclear Data Files	20
3.4 Multigroup Nuclear Data Libraries	23
4. The Neutron Transport Equation	29
4.1 Integral Forms of the Transport Equation	30
4.2 Eigenvalues and Criticality	34
5. The Treatment of Energy, Angle and Space	36
5.1 Energy	37
5.2 Angle	38
5.3 Space	40
6. The Computational Flow Chart	41
Questions	47
References	47
II. SOME PRINCIPLES OF PROGRAMMING	49
1. Introduction	49
2. Input and Output	50
2.1 Input	50
2.2 Output	54
3. Subroutines (SR)	58
4. Program Structure	65
5. Variable Dimensioning	69
6. Data Transfer between Links	74

7. Direct or Random Access	76
8. Sundries	76
Questions	79
III. DESCRIPTION OF A TYPICAL NUCLEAR DATA LIBRARY	80
1. Introduction	80
2. General Data	82
3. Resonance Data	86
4. Cross-Section Data	88
5. P1-Scattering Data	94
6. Burnup Data	96
7. Concluding Remarks	97
7.1 The Identifiers	97
7.2 Temperature Dependence of Nuclear Data	98
7.3 Burnable Absorber Tables	99
7.4 Group Structures	100
7.5 Some Typical Sizes	104
References	104
IV. INTEGRAL TRANSPORT THEORY; COLLISION PROBABILITIES	105
1. Reduction to One-Group Equations	105
2. The Group Source	106
3. The Transport Correction	107
4. The One-Group Integral Transport Equation	107
5. The Kernel of the Integral Transport Equation: Examples	109
6. The Bickley Functions $K_i(x)$	113
7. Transport Kernel and First-Flight Collision Probabilities	115
8. Blackness and Escape Probability	117
9. Collision Probabilities in Cylindrical Geometry	119
9.1 Annular Geometry	121
10. Application of Collision Probabilities	126
10.1 A partially Reflected Cell with an External Incident Current	129
Questions	140
References	140
V. THE P_L APPROXIMATION AND DIFFUSION THEORY	142
1. The General P_L Equations	142
2. The General P_1 Equations	146
3. The Diffusion Equation	149
4. The Transport Correction	151
5. Multigroup Equations	152
6. Boundary Conditions (BC)	155
6.1 Free Surface Boundary Conditions (Marshak, Mark)	155
6.2 Periodic Boundary Conditions	158

6.3	Reflective Boundary Conditions	159
6.4	Albedo Boundary Conditions	160
6.5	Interface Conditions	163
7.	One-Dimensional Finite Difference (FD) Equations	164
7.1	Three-Point FD Equation for the Flux in P1 Theory	164
7.2	Three-Point FD Equation for the Flux in Diffusion Theory	166
7.3	Discussion of the FD Approximations	168
8.	Multi-Dimensional FD Equations	170
8.1	Boundary Conditions	172
8.2	A Warning on the Choice of Mesh Points	173
9.	Iteration Methods to Solve the FD Equations	176
9.1	Gauss, Jacobi, Richardson, or Total-Step Iteration	182
9.2	Gauss-Seidel, Liebmann, or Single-Step Iteration	183
9.3	The Successive Overrelaxation (SOR) Method	184
9.4	Normalization or Scaling	185
9.5	Convergence and the Stopping Criterion	188
	Questions	189
	References	190
VI.	THE DISCRETE ORDINATES OR DISCRETE S_N METHOD	191
1.	The Multigroup Discrete Ordinates Equations	191
2.	Discretization of Space and Angle	195
2.1	Rectangular Geometry	195
2.2	Spherical Symmetric Geometry	197
3.	Discrete Angles and Weights	202
3.1	General Conditions	202
3.2	Complete Symmetry	203
3.3	Selection of Weights	207
3.4	Discrete Ordinates in Plane Geometry	209
4.	Boundary Conditions	211
5.	Differences Schemes	213
5.1	An Analysis of the Difference Schemes	215
5.2	Negative Flux Fix-Up	217
6.	Evaluation Rules for the Recursion Formula	219
7.	Iteration Methods	223
8.	The Ray Effect	226
	Questions	228
	References	230
VII.	A NODAL METHOD FOR PIN-CELL COUPLING; PIN-CELL HOMOGENIZATION	231
1.	General Remarks	231
2.	The Nodal Model	234
3.	The Albedo Boundary Condition	237
4.	Iterative Solution of the Nodal Equation	238
4.1	The Normalization Condition	239

5. Nodal Coefficients for Heterogeneous Nodes	241
5.1 Heterogeneous Boundaries: M_B , J_B^- and a_B	242
6. Source Term and Flux	245
7. The Algorithm	246
8. Pin-Cell Homogenization	247
8.1 Cross-Section Homogenization	249
8.2 A Homogenization Paradox	250
8.3 The Homogenization Source	252
Questions	255
References	256
 VIII. MULTIGROUP ITERATION METHODS	 257
1. Introduction	257
1.1 Physical Considerations	258
1.2 Eigenvalue and Eigenvector of the Multigroup Scheme	262
2. The Initial Guess	264
3. The Fission Source	267
4. The Eigenvalue or Outer Iterations	268
5. The Up-Scattering or Thermal Iterations	270
5.1 Fundamental Mode Rebalancing	271
6. The Convergence Criterion	274
7. Programming Remarks	275
7.1 Structuring the Working File	276
7.2 Evaluation of the Scattering Source	278
7.3 Multigroup Fixed-Source Iterations	280
Questions	284
References	284
 IX. GROUP CONSTANTS IN THE RESONANCE REGION	 286
1. General Remarks	286
2.1 First-Flight Probabilities for the Average Pin Cell	288
3. First-Flight Fuel Collision Probability for an Assembly	292
3.1 Cells without Fuel	294
3.2 The Dancoff Factor	296
4. Rational Approximations	297
5. The Resonance Flux in a Homogeneous Medium	302
5.1 The Intermediate Resonance Approximation	305
5.2 RI Tables and IR Parameters of the XS Library	307
6. The Resonance Flux in the Fuel of an Assembly	308
6.1 The Flat Flux Approximation	310
6.2 The IR Approximation in Heterogeneous Media	312
6.3 An Equivalence Relation	313
6.4 An Equivalent One-Term Rational Approximation	316
7. Effective Resonance Cross-Sections	317
7.1 Interaction between Resonance Absorbers	321
8. Removal Cross-Sections	323

9. Different Pin Types	328
10. Summary	334
Questions	335
References	335
 X. THE CRITICALITY SPECTRUM; BURNUP	 337
1. Introduction	337
2. Fluxes for Homogenization and Condensation	338
2.1 Microflux Evaluation	338
2.2 Infinite-Medium Flux and Criticality Flux	342
2.3 Condensation Spectra for Library Cross-Sections	343
2.4 Homogenization and the Spatial Microflux	344
2.5 Condensation and the Microflux Spectrum	345
2.6 Evaluation of the Macroflux	348
2.7 Homogenization and Condensation with the Macroflux	349
3. A Two-Group Analysis of Condensation Spectra	351
3.1 The Infinite-Medium Spectrum	352
3.2 The Leakage Spectrum in Two-Group Diffusion Theory	353
3.3 Criticality of a Bare Homogeneous System	356
3.4 Other Spectra; Discussion	357
4. The B1 Method for the Asymptotic Spectrum	360
4.1 The P1 and B1 Equations	363
4.2 Solution of the B1 Equations	366
4.3 The B1 Diffusion Coefficient	372
5. Flux Expansion and Scaling to Power	373
6. Burnup Chains	377
6.1 The Exact Solution of a Burnup Chain	380
6.2 The Stratagem of England	384
7. Assembly and Reactor Burnup	387
7.1 The Predictor-Corrector Method	388
7.2 Reactor Burnup	389
7.3 Doppler and Xenon Effects	390
Questions	391
References	392
 XI. NODAL EQUATIONS FOR 3D REACTOR CALCULATIONS	 393
1. General Remarks	393
1.1 Geometric Ordering	398
2. The Response Matrix (RM) Method	400
2.1 The High-Order Response Matrix Method	404
3. Nodal Equations from the Response Matrix	405
3.1 The Synthetic Response Matrix	407
3.2 The Nodal Equation of the Synthetic Response Matrix	409
3.3 Solution of the Response Matrix Nodal Equations	413
3.4 The Nodal Equation of TRILUX	415

3.5	Iterative Solution of the One-Group Nodal Equation	418
3.6	The Chebyshev Polynomial Method	422
3.7	The Nodal Equation of FLARE	424
3.8	Synthesizing the Response Matrix	427
4.	The Nodal Equation of the Coarse-Mesh Method	429
4.1	The Response Matrix of the Coarse-Mesh Method	429
4.2	Synthesizing the Coarse-Mesh Response Matrix	430
4.3	The Coarse-Mesh Equation	432
4.4	Solution of the Coarse-Mesh Equations	434
5.	1.5-Group Nodal Models	436
5.1	The Buckling Model for the Epithermal Flux	437
5.2	The PRESTO Model for the Epithermal Flux	442
5.3	The Buckling Model in the Thermal Group	444
5.4	The PRESTO Model in the Thermal Group	446
5.5	Thermal Coupling with the Reflector	448
6.	The Equivalence of the two Response Matrices	449
	Questions	451
	References	451
ANSWERS		453
References		485
APPENDIX:	USEFUL CHEBYSHEV EXPANSIONS FOR COLLISION PROBABILITIES	486
1.	Introduction	486
2.	Chebyshev expansions	489
3.	A note on the subroutines	494
	References	496
