

Contents

1	Introduction	1
	Energy conversion and thermodynamics 1. Energy 2. System 3. Energy exchange 4. Thermodynamic equilibrium 7. Properties and state 8. Reversible and irreversible processes 9. Zeroth law of thermodynamics and temperature 10. Temperature measurement and the thermometer 11. Thermometer calibration 13. Pressure 15. System of units 17. Problems 21.	
2	First Law, State Postulate and Applications	23
	Energy conservation principle 23. Energy transfer across boundaries 24. Reversible and irreversible work modes 25. The state postulate 29. Extensive and intensive properties 30. Evaluation of work in specified processes 31. The control volume 35. First law applied to a control volume 35. Throttling and porous plug experiment 39. Other applications of steady flow 40. Problems 41.	
3	Properties of Pure Substances	45
	Simple compressible substance 45. Isothermal processes 47. Vapour quality 48. Thermodynamic properties of steam 49. Temperature-entropy diagram and Mollier chart 50. The p - T diagram 54. Other thermodynamic properties 55. Perfect gas 58. Mixtures of perfect gases 62. Real gas equations of state 63. Incompressible substance 67. Problems 68.	
4	Second Law of Thermodynamics: Entropy	72
	Some definitions 72. Second law of thermodynamics 73. Reversible and irreversible processes 75. The Carnot cycle 78. Corollaries of the second law: Carnot theorems 79. Thermodynamic temperature scale 80. Equivalence of perfect gas and thermodynamic scales 82. Clausius inequality 83. Entropy 84. Principle of entropy increase 86. Problems 88.	
5	Applications of Second Law: Thermodynamic Relations	91
	Thermodynamic and mechanical pressures: Gibbs	

	equation 91. Entropy changes in various processes 92. Differential equations of state 95. Maxwell relations 97. <i>Tds</i> relations 97. Clapeyron equation 98. Applications to a perfect gas 101. Problems 103.	
6	Availability and Irreversibility	106
	High and low grades of energy 106. Available energy 106. Availability 107. Reversible work 110. Evaluation of real processes 111. Availability balance 115. Problems 118.	
7	Thermodynamic Cycles	120
	Power generating cycles 120. Otto, Diesel and dual cycles 120. Brayton cycle 124. Compound cycles 129. Jet propulsion 129. Rankine cycle 131. Superheat and reheat cycles 133. Regenerative steam cycle 134. Supercritical and binary vapour cycles 138. Refrigeration cycles 139. Direct energy conversion 144. Problems 147.	
8	Statistical Principles and Entropy	151
	Some quantum concepts 151. Micro and macrostates 155. Statistical models 160. Bose-Einstein statistics 160. Fermi-Dirac statistics 162. Maxwell-Boltzmann statistics 163. Transitions and microstates 165. Trend towards equilibrium 168. Entropy and the second law 168. Partition function and entropy 170. Conditions for equilibrium: Gibbs equation 170. Determination of λ and β 172. Behaviour at absolute zero 173. Applications of quantum statistics 174. The third law of thermodynamics 179. Problems 183.	
9	Kinetic Theory and Statistics	185
	Introduction 185. Assumptions of kinetic theory 185. Collisions with a wall: perfect gas 187. Statistical model for perfect gas 189. Principles of energy equipartition 190. Maxwell-Boltzmann distribution 193. Binary collisions: mean free path 197. Survival equation 199. Problems 201.	
	Appendix	205
	Tables of thermodynamic properties 205.	
	Index	235
