

Contents

1	Sources of Energy	1
	Energy demand 1. Available energy sources 1. Direct solar energy 3. Fossil fuels, solid, liquid and gaseous 7. Hydraulic power 12. Nuclear power 14. Other Sources of energy 15. Summary 17. Problems 18.	
2	Principles of Thermal Energy Release	19
	Introduction 19. Structure of hydrocarbons 19. Analysis of fuels 22. Combustion 23. Mass balance 25. Combustion control through flue gas analysis 30. Energy release in combustion 37. Enthalpy of formation 42. Adiabatic flame temperature 45. Combustion in steady flow 48. Combustion and related efficiencies 49. Second law analysis of combustion processes 51. Absolute entropy and the third law 52. The availability of fuels 53. Irreversibility in adiabatic combustion 55. Nuclear particles and interactions 56. Radioactive decay 60. Nuclear cross-sections 61. Fission reaction 63. The nuclear reactor 65. Neutron multiplication factor 66. Reactor power generation rate 67. Problems 71.	
3	Principles of Thermal Energy to Work Conversion Devices	74
	Introduction 74. Number and sequential order of components in a heat engine 75. Heat engine working cycles 78. Principal types of non-phase change cycles 79. Comparison of practical engine cycles 83. Properties of air and air tables 90. Regenerative cycles 94. The Brayton cycle 94. Brayton cycle with regeneration 104. Brayton cycles with multistage compression and expansion, intercooling and reheating 106. Closed cycles and their advantages 110. Jet propulsion 111. Problems 113.	
4	The Internal Combustion Engine	120
	Reciprocating devices and internal combustion engines 120. Types of internal combustion engines 122. Some terms and definitions relating to I. C. engines 131.	

The gas engine 137. The actual indicator diagrams 140. Volumetric efficiency 142. Energy input and real cycle efficiency 144. Knocking and detonation in I.C. engines 147. Performance characteristics of I.C. engines 150. Testing of I.C. engines 153. Energy balance on an I.C. engine 155. Problems 161.

5 Phase Change Cycles 166

The Rankine cycle 166. Effects of pressure and temperature on efficiency 169. Deviations of the actual Rankine cycle from the ideal cycle 175. Regenerative feed-water heating 180. Types of feed-water heaters 183. Irreversibilities in vapour-power cycles 188. The supercritical pressure and binary-vapour cycles 192. The steam engine 194. Problems 201.

6 Reciprocating Compressors 206

The air compressor 206. Work input for single-stage compression 207. Effect of clearance 208. Real indicator diagrams 210. Multistage air compressor 216. Optimum interstage pressure 218. Energy exchange in multistage compression 220. The refrigerant vapour compressor 225. Problems 226.

7 Refrigeration 230

Introduction 230. The air-cycle refrigeration 232. The mechanical vapour-compression cycle 238. Practical vapour-compression cycle 240. Desirable properties of refrigerants 242. Common refrigerants 243. Vapour-absorption refrigeration system 249. The heat pump 252. Mixtures of air and water vapour 253. Adiabatic saturation temperature 254. The psychrometric chart 256. Problems 260.

Appendix 262

Tables of Thermodynamic Properties 264.
