

## CONTENTS:

	page
Preface	VII
Thermodynamic aspects of geothermal energy	
J. Goguel	
Introduction	1
Energy of life	3
Energy of the solar system	4
Internal energy of the Earth	5
Gravitational equilibrium	7
The budget of internal energy	7
Mechanical energy	8
Energy of the magnetic field	10
Radioactive elements in rocks	11
How much stored heat is there?	14
Geothermal energy development	16
Phreatic explosions	18
Geothermal site	22
Low-energy systems	23
Natural replenishment or reinjection?	24
Long term effect of reinjection	25
High energy systems	29
The development of geothermal high energy systems	30
Ground-water convection	32
Steam reservoirs	36
Natural cooling of geothermal sites	39
Exploration for geothermal systems	41
Development of geothermal systems	41
Water-dominated systems	41
Steam-dominated systems	44
Management of a geothermal plant	47
Binary cycle	48
What about hot dry rocks?	49
Geographic distribution of high energy systems	50
Geophysical methods in prospecting for geothermal resources	
G.V. Keller	
Introduction	51
Geophysical methods	52
Thermal gradient and heat flow	52
Electrical resistivity methods	54
Self-potential surveys	64
Curie Point determination	65
Passive seismic methods	67
Case histories	70
Black Rock Desert prospect	70
The Puna geothermal prospect	77
References	81

## Geothermal prospecting for geothermal fields

F. Mongelli

Introduction	83
Delimitation of surface anomalies	83
Temperature gradient measurements	83
Thermal conductivity measurements	84
Method for soft rocks	84
Methods for hard rocks	86
Heat flow calculation	88
Extrapolation of shallow data	88
Variations of thermal conductivity of rocks versus depth	88
Perturbations of geotemperatures	91
Topography with uplift and erosion	92
Sedimentation	92
Climatic changes	93
Heat sources	93
Conclusion	97
References	98

## Low enthalpy geothermal fields, with reference to geothermal energy in France

J. Varet

Introduction	100
Classification of geothermal resources	102
Geological classification	102
Aquifers in large sedimentary basins	102
Aquifers in tectonized basins	102
Geothermal waters in fissured crystalline massifs (metamorphic or granitic)	105
Geothermal systems in volcanic massifs	105
Geochemical classification	105
Fresh water	108
Brackish water	108
Saline water (10-35 g/l)	108
Brines (over 35 g/l)	108
Temperature classification	108
Below 50°C	108
Between 50 and 80°C	110
Between 80 and 150°C	110
Over 150°C	110
Inventory of hot water reservoirs	113
Geological data	113
Temperature gradients and heat flow	113
Hydrochemistry	113
Potentiometric surface	116
Transmissivity	116
Exploitation techniques	116
"Doublet characteristics"	117
Drilling techniques	117
Drilling cost	121
Geothermal plant design	121
Production problems	121
Thermal needs at the surface	122

District heating	122
Agricultural uses	122
Industrial uses	127
Economy of low enthalpy geothermal energy	128
Some examples	128
Melun-Mée sur Seine (under construction)	128
Melun l'Almont	129
Creil	130
Villeneuve-la-Garenne	131
Mont-de-Marsan	132
Geothermal policy in France	133
Man-made geothermal reservoirs	
A.C. Gringarten	
Introduction	134
The hot-dry-rock concept	135
Heat extraction from hot dry rock	138
Simplified model	138
Example of calculation	144
Refined heat transfer model	147
Effects of thermal stress cracking	149
The LASL HDR Project	151
Drilling and testing	153
Drilling GT-2	153
Hydraulic fracturing experiment	154
Drilling EE-1	154
Conclusion	157
References	157
Technical, physical and economic problems in the development and use of petrogeothermal resources	
Y.D. Diadkin	
Introduction	159
Technology of artificial geothermal systems	160
Heat and mass transfer processes in closed circulation systems	166
Porous reservoirs	166
Fractured reservoirs	168
Cavity reservoirs	173
Geothermal wells	178
Economics of circulation systems	183
Energy potential of petrogeothermal resources	193
References	200
Physical and geophysical aspects of solar energy	
V. Silvestrini	
Introduction	202
An alternative technical and political role of solar energy	204
Natural cooling	205
The physical principle	205
Properties of components and calculation of performance	208
Nocturnal performance	211
Diurnal performance	213

Shading from direct solar radiation	214
Average performance	216
Conclusions	218
Domestic applications of solar energy	218
Flat plate solar collectors	218
Economic considerations	220
Solar buildings	222
Optimal reduction of thermal losses	223
Positioning and optimal dimensioning of solar collectors	225
Climate as a design parameter	230
Introduction	230
Experimental data and elaboration methods of solar energy availability	231
Monthly average solar radiation on a surface with arbitrary orientation	232
The useful energy extracted from a solar collector	238
From daily averages to hourly data	241
From monthly averages to daily distributions	243
Conclusions	245
Large scale control of the ambient conditions	245
Introduction	245
The temperature of large expanses of water	246
Large scale control of the ambient temperature	248
Intensity and quality of light	252
Humidity and fresh water	255
A proposal for a culture in controlled ambient conditions	257
References	258
Geochemistry and geology of Uranium deposits	
P. Gasparini and M.S.M. Mantovani	
Introduction	260
Geochemistry of Uranium	262
Uranium deposits	266
Low grade U reserves	274
Acknowledgments	276
References	276
Earthquakes and security of nuclear plants	
A. Castellani	
Introduction	279
Interaction of the plant and the environment	280
Earthquake risk evaluation	281
Safe Shut-down Earthquake (SSE)	282
Measures taken in the member countries of the European Communities for seismic design, compared to actual US practice	286
References	288
Atmospheric and water pollution from power plants	
D.J. Moore	
Emissions	290
Introduction	290
Boiler plant	293

Gas turbines	294
Nuclear plants	295
Atmospheric dispersion	295
Introduction	295
The effect of tall chimneys	295
Formulae for calculating plume rise	297
Plumes with negative buoyancy	297
The effect of multiple sources	297
Atmospheric dispersion	298
The mixing layer	298
The external parameters of the mixing layer	299
Surface roughness	299
The Coriolis force	300
The free stream wind velocity	300
The internal parameters	301
Eddy diffusivity	301
The lateral spread of the plume	302
The effect of sampling time	302
The diffusivity profile	303
Diffusivity models	303
Gaussian models	304
Calculation of ground level concentration	304
The effect of buildings and topographical features	305
Urban mixing layers	305
Land-and sea-breeze effects	306
Long range transport and accumulation in the atmosphere	306
Deposition or accumulation	306
Dry deposition	307
Wet deposition	307
Homogeneous chemical reactions	309
Heterogeneous reactions	309
Air-water pollution interactions	310
Accumulation of gases in the atmosphere	310
Disposal of waste heat from power stations	311
Direct cooling	311
Introduction	311
Discharges to estuaries and the sea	312
Investigation techniques	312
Infra-red and boat surveys	312
Mathematical methods	313
Hydraulic models	314
Cooling ponds	315
General	315
Experimental data	316
Prediction equation	317
The effect of buoyancy	319
Mixing processes	319
Cooling towers	320
Introduction	320
The nature of the WNDCT discharge	321
Environmental problems of WNDCT compared with WADCT	322
Large bulk of the towers	322

Persistent plumes	322
Precipitation from cooling tower plumes	323
Entrainment of moist air into the wake of the towers	323
Climatic effects of cooling tower stations	324
Interaction of cooling tower and stack plumes	324
References	325
