Chapter 1	*Computers in Engineering*	*1*
1.1	Engineering, Computers and Numerical Methods	1
1.2	An Engineer's View of a Computer	5
1.3	Programming Languages	11
1.4	Programming a Problem Solution	14
1.5	Programs presented in the Book	16
Chapter 2	*Matrix Algebra by Computers*	*18*
2.1	Introduction	18
2.2	Elementary Matrix Operations	19
2.3	Solution of Systems of Simultaneous Linear Equations	34
2.4	Eigenvalue and Eigenvector Problems	72
2.5	Quadratic Forms	90
2.6	Matrix Representation of Extremum Problems	91
Chapter 3	*Matrix Analysis of Simple Structural Systems*	*100*
3.1	Introduction	100
3.2	Displacement Method – Truss	102
3.3	Computer Matrix Displacement Method	110
3.4	A Computer Program for Truss Analysis	125
Chapter 4	*Solid Mechanics*	*152*
4.1	Introduction	152
4.2	Principle of Virtual Displacement	158
4.3	Principle of Minimum Potential Energy	164
4.4	Program for Static Analysis of Plane Frame Systems	178
4.5	Dynamic Problems	191
4.6	Program for Dynamic Analysis of Plane Frame Systems	198
Chapter 5	*Approximate Methods of Solution*	*218*
5.1	Introduction	218
5.2	The Rayleigh-Ritz Method	218
5.3	The Galerkin Method	235
Chapter 6	*The Finite Element Technique*	*250*
6.1	Introduction	250
6.2	Extended Laplace Equation	257
6.3	A Program for the Solution of the Extended Laplace Equation	272
6.4	Two-Dimensional Elasticity Problems	288
6.5	Computer Program for Finite Element Analysis of Plane Stress Problems	295
6.6	Higher Order Elements	307

Chapter 7 *Fluid Mechanics* 322
7.1 Introduction 322
7.2 Governing Equations 324
7.3 Perfect Fluids 326
7.4 Applications in Hydraulics 338
7.5 Flow through Porous Media 344
Index 352

LIST OF PROGRAMS

Chapter 2

1. Transpose of a rectangular matrix (TRANR). 22
2. Transpose of a square matrix (TRANS). 23
3. Addition and subtraction of matrices (ADSUB). 24
4. Multiplication of two matrices (ATIMB). 26
5. Multiplication of two matrices, storing the results in the first matrix (MATMA). 26
6. Multiplication of two matrices, storing the results in the second matrix (MATMB). 27
7, Evaluation of $\mathbf{C} = \mathbf{B}^T\mathbf{AB}$, using previous routines (BTAB1). 28
8. Evaluation of $\mathbf{C} = \mathbf{B}^T\mathbf{AB}$, without using previous routines (BTAB2). 29
9. Evaluation of $\mathbf{C} = \mathbf{B}^T\mathbf{AB}$, storing the result in **A** (BTAB3). 29
10. Multiplication of a matrix by a vector (MULTV). 31
11. Solution of simultaneous linear systems of equations, by the Gauss elimination method, without allowing for row interchange (SLPDS). 41
12. Solution of simultaneous systems of equations, by the Gauss elimination method, allowing for row interchange (SLNPD). 44
13. Solution of simultaneous systems of equations, by the Gauss elimination method, for positive definite symmetric matrices (SLSIM). 45
14. Solution of simultaneous systems of equations, by the Gauss elimination method, for banded matrices (SLBNS). 51
15. Solution of simultaneous systems of equations, by the Gauss elimination method, for symmetric banded matrices (SLBSI). 52
16. Inverse of a matrix by the Gauss elimination method (INVER). 55
17. Decomposition of a symmetric matrix using Choleski's method (DECOG). 59
18. Decomposition of a symmetric banded matrix using Choleski's method (DECOB). 60
19. Solution of equations using Choleski's method (CHOLE). 61
20. Inverse of an upper triangle matrix (INVCH). 61

21. Solution of equations using Gauss–Seidel iterative method (SLGSG). 67
22. Solution of symmetric banded matrices using Gauss–Seidel (SLESS). 70
23. First eigenvalue and eigenvector, by the Stodolla-Vianello method (EIGIS). 78
24. Computation of eigenvalues and eigenvectors, for a system of the type $\mathbf{AX} = \lambda\mathbf{X}$, by the Jacobi method (JACOB). 86
25. Computation of eigenvalues and eigenvectors, for a system of the type $\mathbf{AX} = \lambda\mathbf{BX}$ (EIGG). 89

Chapter 3.

Programs for static analysis of plane trusses

26. Main program. 128
27. Data input (INPUT). 130
28. Assembling of the total stiffness matrix (ASSEM). 133
29. Computation of the plane truss bar stiffness matrix (STIFF). 135
30. Addition of an element stiffness matrix to the total stiffness matrix (ELASS). 136
31. Introduction of boundary conditions (BOUND). 141
32. Evaluation of bar axial forces (FORCE). 145
33. Result output (OUTPT). 146

Chapter 4.

Programs for static analysis of plane frame systems

34. Main program. 179
35. Input program (INPUT). 180
36. Evaluation of the plane frame member stiffness matrix (STIFF). 183
37. Evaluation of member end forces (FORCE). 184
38. Output program (OUTPT). 187

Programs for dynamic analysis of plane frame systems

39. Main program. 200
40. Data input (INPUT). 201
41. Assembling of the total stiffness and mass matrices (ASSEM). 203
42. Computation of the element mass matrix (EMASS). 204
43. Addition of the element matrices into the total matrices (ELASS). 206
44. Output program (OUTPT). 208

Chapter 6

Programs for the solution of the generalized Laplace's equation

45. Main program. 273
46. Input program (INPUT). 274
47. Computation of element matrices (STIFF). 276
48. Routine for calculating the nodal variables derivatives (FORCE). 278
49. Output program (OUTPT). 279

Programs for the solution of bidimensional elasticity problems

50. Main program. 296
51. Input program (INPUT). 298
52. Element stiffness matrix (STIFF). 300
53. Evaluation of element stresses (FORCE). 301
54. Output program (OUTPT). 303
