EDITORIAL FOREWORD	xiii
INTERNATIONAL CO-OPERATION IN HIGH-SPEED PHOTOGRAPHY	xiv
FOREWORD	xv
INTRODUCTION. <i>Classification of Methods and Equipment used in High-speed Photography</i>	xvii

PART I

PHOTOGRAPHIC RECORDING OF HIGH-SPEED PROCESSES BY MEANS OF SLIT SCANNING 1

CHAPTER 1. <i>Photographic Recording Methods with Slit Scanning</i>	
1. Photographic recording with moving photographic material	3
2. Photographic recording with stationary photographic material	8
3. Accuracy of determining the rate of development of a process	9
CHAPTER 2. <i>Moving Film Cameras</i>	14
4. Principal elements of camera optical systems	14
5. Types of moving film camera	18
1. The drum camera	18
2. Cameras with continuous film feed	20
CHAPTER 3. <i>The Theory of Mirror Scanning</i>	22
6. Geometrical format of the image in mirror scanning	22
7. Shape of the film surfaces in photorecorders	28
1. Substitution of the real image format by a plane	28
2. Substitution of the real image format by the surface of a right circular cylinder	29
8. Rate of image movement in the general case of mirror scanning	32
9. Mirror scanning with inclined mirrors	34
10. Mirror scanning with inclined beams	41
11. Mirror scanning systems in cameras	44
12. Resolving power of mirror cameras	49
13. Dynamic strength of the mirrors and change of shape of the reflecting surfaces as a result of rotation	52

CHAPTER 4. <i>Cameras with Stationary Film (with Mirror Scanning)</i>	60
14. Modern high-speed cameras	61
1. The SFR high-speed camera of the Institute of Chemical Physics, Academy of Sciences, USSR	61
2. Continuous-scan high-speed cameras ZhFR-1, ZhFR-2 and ZhFR-3 of the Institute of Chemical Physics, Academy of Sciences, USSR	68
3. The Barr and Stroud high-speed camera	72
4. The Brixner streak camera of relative aperture $f/10$	73
5. The California University high-speed camera	74
6. High-speed FR-30 continuous-access camera of the Institute of Terrestrial Physics, Academy of Sciences, USSR	75
15. High aperture ratio, high-speed cameras	75
1. Camera with $f/1$ aperture	77
2. High aperture ratio, high-speed camera of the continuous-access "NIS" type	78
PART II	
PHOTOGRAPHIC RECORDING OF HIGH-SPEED PROCESSES WITH HIGH-SPEED CINECAMERAS	
	83
CHAPTER 5. <i>Principal Parameters of High-speed Cinecameras</i>	85
16. Writing speed, focal length, field of view and total recording time	86
17. Aperture ratio of high-speed cinecameras	94
CHAPTER 6. <i>High-speed Photography with Image Dissection Cameras</i>	101
18. Operating principles and construction of cinecameras with image dissection	101
CHAPTER 7. <i>High-speed Photography with Raster Cameras</i>	105
19. Rasters	107
20. Basic principles of construction of raster high-speed cinecameras	112
21. Raster high-speed cameras with movement of the objective exit pupil of the camera lens	113
22. Raster high-speed cameras with rotary movement of the photographic material or of the raster	118
23. Raster high-speed cameras with stepwise movement of the photographic film or raster	120
24. Aperture ratio of raster cinecameras	121
1. Aperture ratio of a raster cinecamera with a slotted raster	122
2. Aperture ratio of a raster cinecamera with a lenticular point raster	123

25. Raster high-speed cameras with mirror scanning	124
1. Theory of mirror scanning of a raster image	124
(a) Mirror scanning of a raster image on a plane	125
(b) Mirror scanning of a raster image on a cylindrical surface	132
(c) Resolution in raster cameras with mirror scanning	134
2. Raster high-speed cameras with mirror scanning	135
(a) Mirror raster high-speed cameras with a ruled raster	135
(b) The RKS-1 raster high-speed camera	137
(c) The SFR-R raster high-speed photomicrographic camera	141
CHAPTER 8. <i>High-speed Photography with Slit-shutter Cameras</i>	146
26. Operating principles and basic elements of high-speed cinecameras with slit shutters	146
27. High-speed cinecameras with a slit shutter	151
CHAPTER 9. <i>High-speed Photography with Optically Compensated cameras</i>	160
28. Theory of high-speed cinecameras with optical image compensation (Miller System)	161
1. General design principles of an optically compensated camera	161
2. Basic elements and dimensions of the optical system	162
3. Image movement in cameras with optical compensation	171
4. Shape of the focal surface and the writing speed in optically compensated systems	183
5. Non-uniformity of the writing speed	189
29. Calculations for high-speed cinecameras with optical compensation	194
30. Continuous-access mirror-scanning systems in cameras with optical compensation	199
1. Plane single-sided mirror (one reflecting surface)	200
2. Plane double-sided mirror (two reflecting surfaces)	202
3. The trihedral mirror	205
4. The tetrahedral mirror	210
31. Modern high-speed cameras with optical image compensation	212
1. Cameras with synchronization of the start of the process and start of recording	217
(a) The SFR high-speed camera	217
2. Cameras with continuous mirror scanning	224
(a) The continuous-access high-speed cinecamera ZhLV-1	230

CHAPTER 10. <i>High-speed Photography with Multiple-reflection cameras</i>	236
32. Elements of the theory of multiple reflection	237
1. General principle of mirror scanning with multiple reflection in a wedge-shaped gap	237
2. Position of the optical axis in space as a result of multiple reflection	239
3. Position of the centre of scan	241
4. Shape of the focal surface	245
5. Position of the image in space as a result of multiple reflection	249
6. Dimensional calculation of the scanning equipment	251
33. The LV-1 high-speed cinecamera	253
34. The FP-38 camera with optical adaptor	256
CHAPTER 11. <i>High-speed Cinephotography with Optically Compensated cameras</i>	258
35. High-speed cinecameras with lens compensation for the film movement	259
1. Drum-type lens compensator	260
2. High-speed cinecameras with drum-type lens compensators	261
3. Disc-type lens compensator	263
36. High-speed cinecameras with prism compensators for the film movement	264
1. Film movement prism compensator	264
(a) Compensator computation	270
2. High-speed cinecameras with prism compensators for movement of the film	272
37. High-speed cinecameras with mirror compensation for the movement of the film	276
1. Mirror compensation with intermediate image	276
(a) Operating principles	276
(b) Compensator computation	279
(c) Accuracy of operation of the compensator	282
(d) Effect of curvature of the Pascal limaçon on the quality of the image	285
2. Compensators with externally located mirror drum (in front of the camera objective)	288
(a) Compensator with the mirror element located on the external surface of the polyhedron	288
(b) Compensator with mirror element located on the internal surface of the polyhedron	295
3. Compensators with internally located mirror drum	301

(a) Scophony compensator	301
(b) Pyramidal compensator	304
4. Compensation with a "corner-reflector" mirror (ISOTRAN camera)	309
CHAPTER 12. <i>Image Quality in High-speed Cinecameras</i>	314
38. Quantitative determination of the image quality in high- speed cameras	316
PART III	
SPECIAL METHODS FOR PHOTOGRAPHICALLY RECORDING HIGH-SPEED PROCESSES	
	325
CHAPTER 13. <i>High-speed Shadow and Interference Photography</i>	327
39. The shadow method	328
40. The Schlieren method	332
41. The interferometric method	337
42. The use of shadowgraph and interferometric apparatus in conjunction with high-speed cinecameras	342
1. Photography of a shadow picture with the SKS-1 single- objective high-speed camera	343
2. Combined operation of the shadowgraph equipment and a complex SFR-type camera	344
3. High-speed photography of an interference pattern (or interferogram)	353
CHAPTER 14. <i>High-speed Stereophotography</i>	354
43. Stereoscopic vision and stereophotography	354
44. High-speed stereophotography	363
1. Stereophotography by means of two high-speed cameras operating synchronously at identical frequencies	363
2. Stereophotography by means of a single camera with a divided field of view	364
3. High-speed stereophotography by means of an SFR- type camera with optical image compensation	365
45. Processing the results of high-speed stereophotography	368
46. Screen-projection of photographs of high-speed processes and stereoscopic cineprojection	370
CHAPTER 15. <i>High-speed Spectrography</i>	374
47. Design principles of instruments for high-speed spectrography	374
48. Principal characteristics of spectral instruments	377
1. The prism	378
2. The diffraction grating	380
49. Instruments for high-speed spectrography	383
1. Spectrochronographs with continuous film motion	383
2. Spectrochronographs with drum-scanning	384

3. Spectrochronographs with mirror scanning	386
4. Cinespectrographs	389
CHAPTER 16. <i>High-speed Photomicrography</i>	392
50. Methods of designing photomicrographic equipment and their basic units	393
1. Basic units of high-speed photomicrographic equipment	396
2. Methods of designing high-speed photomicrographic equipment	398
51. High-speed photomicrographic equipment	401
CHAPTER 17. <i>High-speed Colour Photography</i>	407
52. Special features of colour photography	407
53. The use of colour photography for recording high-speed processes	409
1. Choice of basic parameters of the equipment and film in high-speed colour photography	410
2. Methods of increasing the light sensitivity of colour film	412
3. The most suitable conditions for processing colour film in high-speed photography	413

PART IV

AUXILIARY EQUIPMENT AND MATERIALS USED IN
HIGH-SPEED PHOTOGRAPHY

	417
CHAPTER 18. <i>High-speed Light Shutters</i>	419
54. Capping shutters	419
55. High-speed shutters for rapid extinction of a light beam	422
1. Electromechanical high-speed shutters	422
2. Electrodynamic high-speed shutters	423
3. Explosive shutters	425
4. A shutter designed on the principle of total internal reflection	429
5. A pneumatic high-speed shutter	430
6. The Kerr shutter for high-speed extinction of a light beam	431
56. High-speed photographic shutters with recurrent action	434
1. Basic concepts and definitions	434
2. High-speed Kerr-cell photographic shutters	438
3. High-speed photographic shutters with image-converter tubes	440
CHAPTER 19. <i>High-speed Drive Mechanisms for Mirror Rotation</i>	452
57. Drive mechanisms with low-frequency electric motors	452
58. Drive mechanisms with high-frequency electric motors	455
59. High-frequency turbine drive mechanisms	458
1. Rotating mirrors	460

2. High-speed sliding bearings	462
3. The circulatory section of the turbine motor	464
4. Automatic air and lubrication feed system for a turbine motor	466
CHAPTER 20. <i>Photographic Materials used in High-speed Photography</i>	468
60. Essential data from sensitometry and the properties of photographic materials	468
61. Methods of improving the properties of photographic materials, as applicable to the requirements of high-speed photography	474
1. Increase of light sensitivity of the film	474
2. Reduction of film shrinkage	475
62. Photographic materials used in high-speed photography	476
