A	The Heuristic	1
A1	The M/M/1 queue.	1
A2	Mosaic processes on \mathbf{R}^2	2
A3	Mosaic processes on other spaces.	5
A4	The heuristic.	5
A5	Estimating clump sizes.	7
A6	The harmonic mean formula.	8
A7	Conditioning on semi-local maxima.	10
A8	The renewal-sojourn method.	11
A9	The ergodic-exit method.	12
A10	Limit assertions.	14
A11–A21	Commentary	15
B	Markov Chain Hitting Times	23
B1	Introduction.	23
B2	The heuristic for Markov hitting times.	24
B3	Example: Basic single server queue.	25
B4	Example: Birth-and-death processes.	25
B5	Example: Patterns in coin-tossing.	26
B6	Example: Card-shuffling.	27
B7	Example: Random walk on $\mathbf{Z}^d \bmod N$	28
B8	Example: Random trapping on \mathbf{Z}^d	28
B9	Example: Two M/M/1 queues in series.	28
B10	Example: Large density of heads in coin-tossing.	29
B11	Counter-example.	30
B12	Hitting small subsets.	30
B13	Example: Patterns in coin-tossing, continued.	31
B14	Example: Runs in biased die-throwing.	31
B15	Example: Random walk on $\mathbf{Z}^d \bmod N$, continued.	32
B16	Hitting sizable subsets.	32
B17	The ergodic-exit form of the heuristic for Markov hitting times.	32
B18	Example: A simple reliability model.	33
B19	Example: Timesharing computer.	33

B20	Example: Two M/M/1 queues in series.	35
B21	Another queueing example.	37
B22	Example: Random regular graphs.	38
B23–B32	Commentary	38
C	Extremes of Stationary Processes	44
C1	Classical i.i.d. extreme value theory.	44
C2	Examples of maxima of i.i.d. sequences.	45
C3	The point process formulation.	47
C4	The heuristic for dependent extrema.	48
C5	Autoregressive and moving average sequences.	48
C6	Example: Exponential tails.	49
C7	Approximate independence of tail values.	50
C8	Example: Superexponential tails.	50
C9	Example: Polynomial tails.	50
C10	The heuristic for dependent extrema (continued).	51
C11	Additive Markov processes on $[0, \infty)$	52
C12	Continuous time processes: the smooth case.	54
C13	Example: System response to external shocks.	55
C14	Example: Uniform distribution of the Poisson process.	56
C15	Drift-jump processes.	57
C16	Example: Positive, additive processes.	58
C17	Example: Signed additive processes.	58
C18	Positive, general drift processes.	58
C19	Autoregressive symmetric stable process.	59
C20	Example: The I5 problem.	60
C21	Approximations for the normal distribution.	62
C22	Gaussian processes.	63
C23	The heuristic for smooth Gaussian processes.	64
C24	Monotonicity convention.	64
C25	High-level behavior of smooth Gaussian processes.	65
C26	Conditioning on semi-local maxima.	66
C27	Variations on a theme.	67
C28	Example: Smooth χ^2 processes.	68
C29–C40	Commentary	69
D	Extremes of Locally Brownian Processes	72
D1	Brownian motion.	72
D2	The heuristic for locally Brownian processes.	73
D3	One-dimensional diffusions.	74
D4	First hitting times for positive-recurrent diffusions.	76
D5	Example: Gamma diffusion.	77
D6	Example: Reflecting Brownian motion.	78
D7	Example: Diffusions under a potential.	78
D8	Example: State-dependent M/M/1 queue.	79

D9	Example: The Ornstein-Uhlenbeck process.	80
D10	Gaussian processes.	81
D11	Example: System response to external shocks.	82
D12	Example: Maximum of self-normalized Brownian bridge. . .	82
D13	Boundary-crossing.	83
D14	Example: Boundary-crossing for reflecting Brownian motion.	84
D15	Example: Brownian LIL.	85
D16	Maxima and boundary-crossing for general Gaussian processes.	86
D17	Example: Maximum of Brownian bridge.	86
D18	Maxima of non-stationary Gaussian processes.	87
D19	Example: Maximum of Brownian Bridge with drift.	88
D20	Example: Brownian motion and quadratic boundary.	88
D21	Example: Ornstein-Uhlenbeck quadratic boundary.	89
D22	Semi-local maxima for the Ornstein-Uhlenbeck process. . .	90
D23	Example: A storage/queuing process.	91
D24	Approximation by unstable Ornstein-Uhlenbeck process. . .	93
D25	Example: Escape from a potential well.	93
D26	Example: Diffusion in random environment.	94
D27	Interpolating between Gaussian processes.	95
D28	Example: Smoothed Ornstein-Uhlenbeck.	95
D29	Boundary-crossing revisited.	97
D30	Tangent approximation for Brownian boundary-crossing. . .	99
D31–D42	Commentary	100
E	Simple Combinatorics	106
E1	Introduction.	106
E2	Poissonization.	107
E3	Example: The birthday problem.	108
E4	Example: K -matches.	109
E5	Example: Unequal probabilities.	109
E6	Example: Marsaglia random number test.	110
E7	Several types of coincidence.	110
E8	Example: Similar bridge hands.	111
E9	Example: Matching K -sets.	112
E10	Example: Nearby pairs.	112
E11	Example: Basic coupon-collectors problem.	113
E12	Example: Time until most boxes have at least one ball. . . .	113
E13	Example: Time until all boxes have at least $(K + 1)$ balls. .	114
E14	Example: Unequal probabilities.	114
E15	Abstract versions of CCP.	114
E16	Example: Counting regular graphs.	115
E17–E22	Commentary	116

F	Combinatorics for Processes	118
F1	Birthday problem for Markov chains.	118
F2	Example: Simple random walk on \mathbf{Z}^K	119
F3	Example: Random walks with large step.	119
F4	Example: Simple random walk on the K -cube.	120
F5	Example: Another card shuffle.	120
F6	Matching problems.	120
F7	Matching blocks.	122
F8	Example: Matching blocks: the i.i.d. case.	122
F9	Example: Matching blocks: the Markov case.	123
F10	Birthday problem for blocks.	124
F11	Covering problems.	124
F12	Covering problems for random walks.	125
F13	Example: Random walk on \mathbf{Z}^d modulo N	126
F14	Example: Simple random walk on the K -cube.	126
F15	Covering problem for i.i.d. blocks.	127
F16	Example: Dispersal of many walks.	127
F17	Example: $M/M/\infty$ combinatorics.	128
F18–F21	Commentary	129
G	Exponential Combinatorial Extrema	131
G1	Introduction.	131
G2	Example: Cliques in random graphs.	132
G3	Example: Covering problem on the K -cube.	133
G4	Example: Optimum partitioning of numbers.	134
G5	Exponential sums.	135
G6	Example: First-passage percolation on the binary tree. . . .	136
G7	Example: Percolation on the K -cube.	138
G8	Example: Bayesian binary strings.	139
G9	Example: Common cycle partitions in random permutations. .	140
G10	Conditioning on maxima.	141
G11	Example: Common subsequences in fair coin-tossing.	141
G12	Example: Anticliques in sparse random graphs.	142
G13	The harmonic mean formula.	143
G14	Example: Partitioning sparse random graphs.	143
G15	Tree-indexed processes.	145
G16	Example: An additive process.	145
G17	Example: An extremal process.	146
G18–G22	Commentary	147
H	Stochastic Geometry	149
H1	Example: Holes and clusters in random scatter.	149
H2	The Poisson line process.	151
H3	A clump size calculation.	152
H4	Example: Empty squares in random scatter.	154

H5	Example: Empty rectangles in random scatter.	156
H6	Example: Overlapping random squares.	157
H7	Example: Covering K times.	159
H8	Example: Several types of particle.	159
H9	Example: Non-uniform distributions.	160
H10	Example: Monochrome squares on colored lattice.	161
H11	Example: Caps and great circles.	161
H12	Example: Covering the line with intervals of random length.	162
H13	Example: Clusters in 1-dimensional Poisson processes.	164
H14–H21	Commentary	165
I	Multi-Dimensional Diffusions	167
I1	Background.	167
I2	The heuristic.	169
I3	Potential function.	169
I4	Reversible diffusions.	169
I5	Ornstein-Uhlenbeck processes.	170
I6	Brownian motion on surface of sphere.	170
I7	Local approximations.	170
I8	Example: Hitting times to small balls.	171
I9	Example: Near misses of moving particles.	171
I10	Example: A simple aggregation-disaggregation model.	173
I11	Example: Extremes for diffusions controlled by potentials.	173
I12	Example: Escape from potential wells.	176
I13	Physical diffusions: Kramers' equation.	177
I14	Example: Extreme values.	178
I15	Example: Escape from potential well.	180
I16	Example: Lower boundaries for transient Brownian motion.	182
I17	Example: Brownian motion on surface of sphere.	183
I18	Rice's formula for conditionally locally Brownian processes.	185
I19	Example: Rough \mathcal{X}^2 processes.	186
I20–I29	Commentary	186
J	Random Fields	190
J1	Spatial processes.	190
J2	In analysis of 1-parameter processes.	190
J3	Gaussian fields and white noise.	190
J4	Analogues of the Kolmogorov-Smirnov test.	191
J5	The heuristic.	192
J6	Discrete processes.	192
J7	Example: Smooth Gaussian fields.	193
J8	Example: 2-dimensional shot noise.	195
J9	Uncorrelated orthogonal increments Gaussian processes.	195
J10	Example: Product Ornstein-Uhlenbeck processes.	196
J11	An artificial example.	197

J12	Maxima of μ -Brownian sheets.	198
J13	1-parameter Brownian bridge.	198
J14	Example: Stationary \times Brownian bridge processes.	200
J15	Example: Range of Brownian bridge.	201
J16	Example: Multidimensional Kolmogorov-Smirnov.	202
J17	Example: Rectangle-indexed sheets.	204
J18	Isotropic Gaussian processes.	205
J19	Slepian's inequality.	206
J20	Bounds from the harmonic mean.	207
J21	Example: Hemispherical caps.	208
J22	Example: Half-plane indexed sheets.	209
J23	The power formula.	212
J24	Self-normalized Gaussian fields.	212
J25	Example: Self-normalized Brownian motion increments.	212
J26	Example: Self-normalized Brownian bridge increments.	213
J27	Example: Upturns in Brownian bridge with drift.	214
J28	Example: 2-parameter LIL.	215
J29–J37	Commentary	216
K	Brownian Motion: Local Distributions	220
K1	Modulus of continuity.	220
K2	Example: The Chung-Erdos-Sirao test.	221
K3	Example: The asymptotic distribution of W	221
K4	Example: Spikes in Brownian motion.	224
K5	Example: Small increments.	225
K6	Example: Integral tests for small increments.	228
K7	Example: Local maxima and points of increase.	230
K8	Example: Self-intersections of d -dimensional Brownian motion.	233
K9–K17	Commentary	234
L	Miscellaneous Examples	237
L1	Example: Meetings of empirical distribution functions.	237
L2	Example: Maximal k -spacing.	238
L3	Example: Increasing runs in i.i.d. sequences.	239
L4	Example: Growing arcs on a circle.	239
L5	Example: The LIL for symmetric stable processes.	241
L6	Example: Min-max of process.	242
L7	2-dimensional random walk	243
L8	Example: Random walk on \mathbb{Z}^2 modulo N	244
L9	Example: Covering problems for 2-dimensional walks.	244

M The Eigenvalue Method	246
M1 Introduction.	246
M2 The asymptotic geometric clump principle.	247
M3 Example: Runs in subsets of Markov chains.	248
M4 Example: Coincident Markov chains.	248
M5 Example: Alternating runs in i.i.d. sequences.	248
M6 Example: Longest busy period in M/G/1 queue.	250
M7 Example: Longest interior sojourn of a diffusion.	250
M8 Example: Boundary crossing for diffusions.	251
