

Contents

Preface	<i>page</i>	<i>ix</i>
I. Introductory Remarks on the Scope of this Monograph		
1. Statistical methods in biology		1
2. Statistical theory in biology		2
II. Ecological Frequency Distributions for Single Species		
1. The Poisson model		5
2. Modified distributions		7
3. Stochastic models in space and time		11
III. Birth-and-death Processes, and the Problem of Extinction		
1. Discrete generations		17
2. Processes in continuous time		18
3. Immigration		20
4. 'Population' processes		21
5. Two types of individual		25
IV. Growth and Interaction		
1. Population growth for a single species		27
2. Density-dependent birth-and-death rates		29
3. Stochastic models		30
4. 'Monte Carlo' methods		33
5. The prey-predator system		35
6. The effect of a lag in births from newly born individuals		40
7. The effect of immigration		42
V. Competition		
1. Competition between species		45
2. Stochastic competition models		47

VI. Epidemic Models	
1. Introductory remarks	<i>page</i> 54
2. The basic stochastic model	55
3. Final epidemic size (exact stochastic treatment)	59
4. Probability chain models	60
VII. Epidemic Models for Recurrent Epidemics	
1. Recurrent epidemics; the model for measles	62
2. The discrete-time model	69
3. Periodicity for small communities	71
4. The problem of chicken-pox	73
VIII. The Spatial or Topographical Factor	
1. General relevance and technique	75
2. Initial spread of an epidemic	75
3. Ultimate behaviour for single and recurrent epidemics	79
4. 'Monte Carlo' results from the Manchester electronic computer	82
Bibliography	85
Index	89
