VIII. HARMONIC ANALYSIS OF RANDOM FUNCTIONS	1
Linear Filter	
1. Introduction	1
2. Linear filters	6
3. Harmonic decomposition	19
4. Some extensions**	22
5. Conclusions	31
IX. ENERGY PROPERTIES OF SECOND ORDER RANDOM FUNCTIONS	35
1. Further discussion of the distribution of the $d^2\gamma(v_1, v_2)$	35
2. General background to the problem of energy properties	41
3. Study of sure quantities: the spectra	44
<i>Part 1. The Mean Instantaneous Power</i>	44
4. Study of sure quantities: the spectra	50
<i>Part 2. Study of the Temporal Mean of the Instantaneous Mean Power</i>	50
5. Study of sure quantities: the spectra	52
<i>Part 3. Study of the Total Mean Energy</i>	52
6. Energy analysis of a random function	54
7. Study of random quantities: ergodicity	55
<i>Part 1. General Introduction</i>	55
8. Study of random quantities: ergodicity	58
<i>Part 2. Ergodic Properties Relating to Power Spectra</i>	58
9. Power spectrum and random functions of several variables**	68
10. Experimental determination of power spectra	74
11. Study of random quantities: ergodicity	77
<i>Part 3. Results Concerning Energy</i>	77

X. SOME PROBLEMS CONNECTED WITH HARMONIC ANALYSIS	83
1. Harmonic analysis and stationarity	83
2. Harmonic analysis and moments of order higher than the second. Fourier series representation of a random function	95
3. Fourier series representation of $X(t)$	102
4. Some remarks on random functions with narrow spectra** .	104
XI. SECOND ORDER STATIONARY RANDOM FUNCTIONS	111
1. Random functions with stationary covariance and continuity in mean square.	111
2. Spectral properties of correlation functions for stationary second order random functions.	112
3. Harmonic analysis of stationary second order random functions	125
4. Second order stationary vector random functions	126
5. Derivatives of random stationary functions	132
6. The law of large numbers	135
7. The strong law of large numbers	136
Bibliographic Note for Chapters 8, 9, 10, 11	140
XII. NORMAL RANDOM FUNCTIONS.	141
I. Stationary Normal Random Functions	141
1. Introduction	141
2. General remarks	143
3. Harmonic analysis of stationary normal random functions .	145
4. Statistical properties of Fresnel's vector for a polarised plane wave**	148
<i>Part 1. General Remarks</i>	148
5. Statistical properties of Fresnel's vector for a polarised plane wave**	149
<i>Part 2. Representation of the Elliptic Oscillations by Means of Poincare's Sphere</i>	149
6. Statistical properties of Fresnel's vector for a polarised plane wave**	156
<i>Part 3. Statistical Properties of the Instantaneous Ellipses</i>	156
7. Evolution of the instantaneous ellipses and ergodicity**	166
8. Some remarks**	175
II. Normal Random Functions in General	188
9. Normal r.f.'s as limits of Poisson r.f.'s	188
10. Functional of a normal random functions	192

XIII. AN APPLICATION: RANDOM NOISE IN COMMUNICATION THEORY	195
1. General remarks	195
2. General characteristics of random noise	199
3. Noise due to electronic emission	202
4. Fluctuations due to thermal agitation of electrons in resistances	207
5. Random noise in antennas	213
6. Sensitivity of receivers, the noise factor, its measurement ...	217
7. Noise and the transmission of information	241
XIV. RANDOM FUNCTIONS AND THE STATISTICAL THEORY OF TURBULENCE by J. Kampé de Fériet	249
I. Introduction	249
II. Statistical Mechanics and Random Functions	253
1. Random functions	253
2. Statistical mechanics of a linear oscillator	255
3. Statistical mechanics of a conservative dynamic system with k degrees of freedom	259
4. The ergodic hypothesis	261
5. Stationary random functions	262
6. Mean values and moments	265
7. The ergodic theorem	267
8. A random function which is strictly stationary on an Abelian group	268
9. Examples of stationary random functions	270
10. Harmonic analysis of random functions which are strictly stationary on locally compact topological group	272
III. Space Homogeneous Turbulence in an Incompressible Fluid	275
11. Introduction	275
12. Space-homogeneous turbulence	276
13. Examples	277
14. Correlation tensor in space-homogeneous turbulence	278
15. Harmonic analysis of space-homogeneous turbulence	280
16. Spectral tensor for space-homogeneous turbulence	282
17. Absolutely continuous spectral tensor	283
18. Correlation tensor for space-homogeneous turbulence in an incompressible fluid	285
19. Spectral tensor for space-homogeneous turbulence in an incompressible fluid	286

20. Spectral tensor and correlation tensor for vorticity	289
21. Space-homogeneous isotropic turbulence	
IV. Dynamics of Homogeneous Turbulence	291
22. Background to the problem	291
23. Reynolds' Equations	293
24. Properties of the means in Reynolds' equations	295
25. Homogeneous turbulence	298
26. Evolution of the energy spectrum	301
V. Statistical mechanics of Fluids	303
27. Introduction	303
28. Characteristic features of classical statistical mechanics	303
29. The phase space	304
30. Uniqueness theorem	305
31. Invariant measure	306
32. Conclusion	307
Bibliography	309
Cumulative Index	321
