

Contents

Part I. Discrete Parameter	Page
§ 1. Fundamental definitions	1
§ 2. Transition probabilities	5
§ 3. Classification of states	11
§ 4. Recurrence	15
§ 5. Criteria and examples	20
§ 6. The main limit theorem	26
§ 7. Various complements	33
§ 8. Repetitive pattern and renewal process	39
§ 9. Taboo probabilities	43
§ 10. The generating function	52
§ 11. The moments of first entrance time distributions	57
§ 12. A random walk example	65
§ 13. System theorems	71
§ 14. Functionals and associated random variables	75
§ 15. Ergodic theorems	85
§ 16. Further limit theorems.	93
§ 17. Almost closed and sojourn sets	106
Part II. Continuous Parameter	
§ 1. Transition matrix: basic properties	114
§ 2. Standard transition matrix	123
§ 3. Differentiability.	130
§ 4. Definitions and measure-theoretic foundations	135
§ 5. The sets of constancy	143
§ 6. Continuity properties of sample functions	152
§ 7. Further specifications of the process	156
§ 8. Optional random variable	160
§ 9. Strong Markov property	168
§ 10. Classification of states	177
§ 11. Taboo probability functions	182
§ 12. Ratio limit theorems.	191
§ 13. Discrete approximations	196
§ 14. Functionals.	203
§ 15. Post-exit process	209
§ 16. Imbedded renewal process	218
§ 17. The two systems of differential equations.	224
§ 18. The minimal solution	229
§ 19. The first infinity	235
§ 20. Examples	244
Addenda	261
Bibliography	271
Index	275
